

The South Atlantic Conservation Blueprint: From planning to action

Rua Mordecai, Science Coordinator

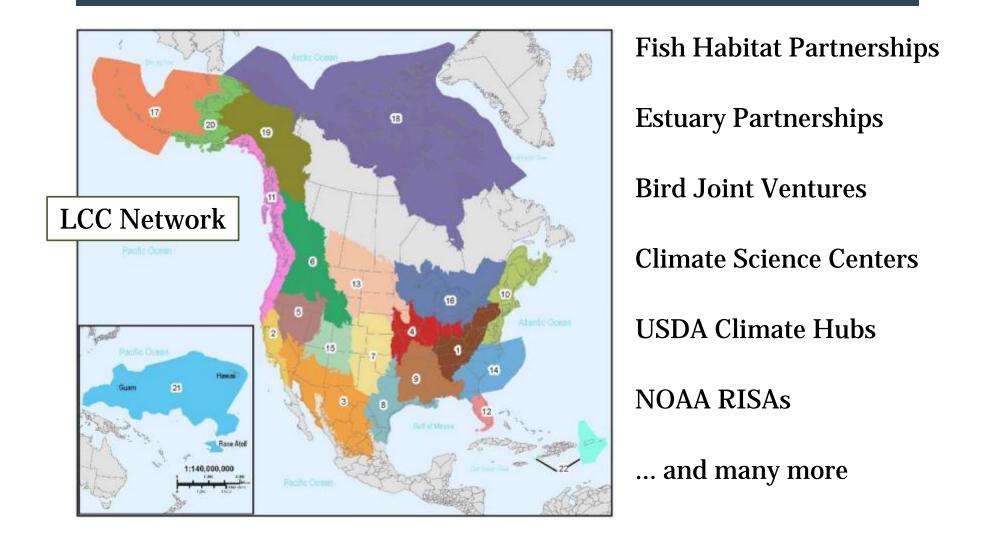

5 - 17 - 2017

Plan for this morning

- Intro to South Atlantic Conservation Blueprint
- Discussion and review of:
 - Spatial priorities
 - Blueprint implementation strategy
- Break
- Ecopath progress
- Ecospace progress

Part of a larger network

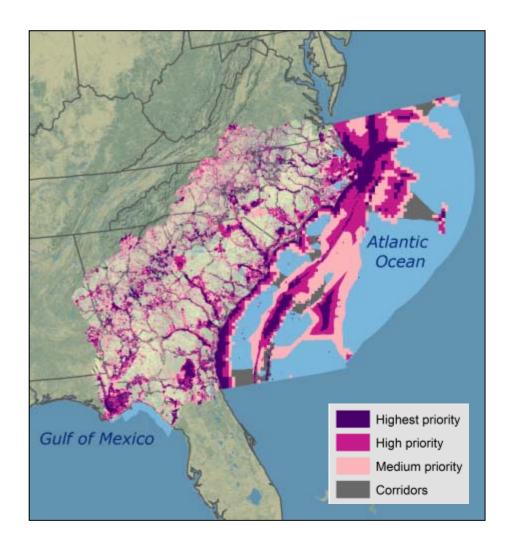

How is your cooperative governed?

What does your cooperative do?

Our mission

 To facilitate conservation actions that sustain natural and cultural resources, guided by a shared adaptive blueprint

What your cooperative do?

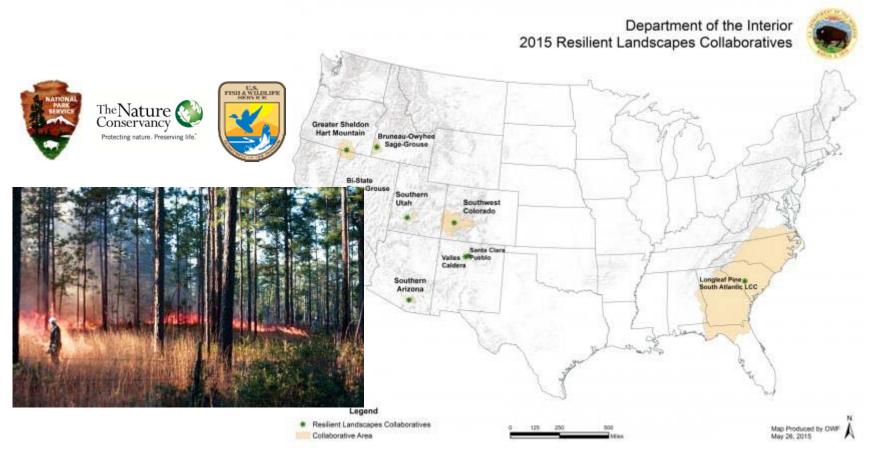

What is the Blueprint?

 A living spatial plan prioritizing opportunities for shared conservation action in the face of future change

How is the Blueprint being used?

- Amplify the impact of existing efforts
 - Bring a landscape perspective to local actions
 - Compete for conservation dollars

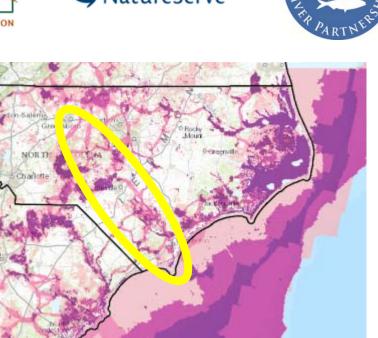

7

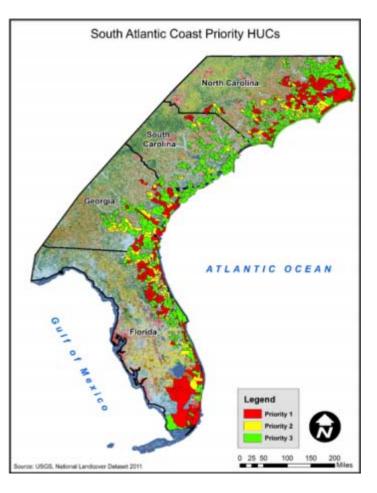

How is the Blueprint being used?

- Anticipate and plan for change
 - Preparing for major disasters
 - Land protection planning

How is the Blueprint being used?

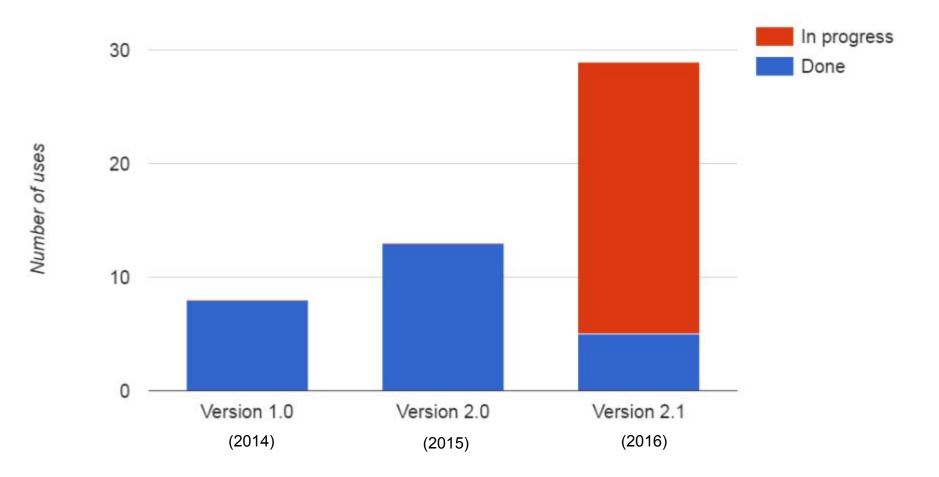

- Adapt to change through conservation action
 - Find the best places to work and partner
 - Implement systems-level solutions

4 Dam Removals on Little River

and Densons Creek, Troy NC

Blueprint use by version

Steps in the Blueprint

- Indicators
- The State of the South Atlantic
- The Blueprint

Indicators

• Integrity of natural resources

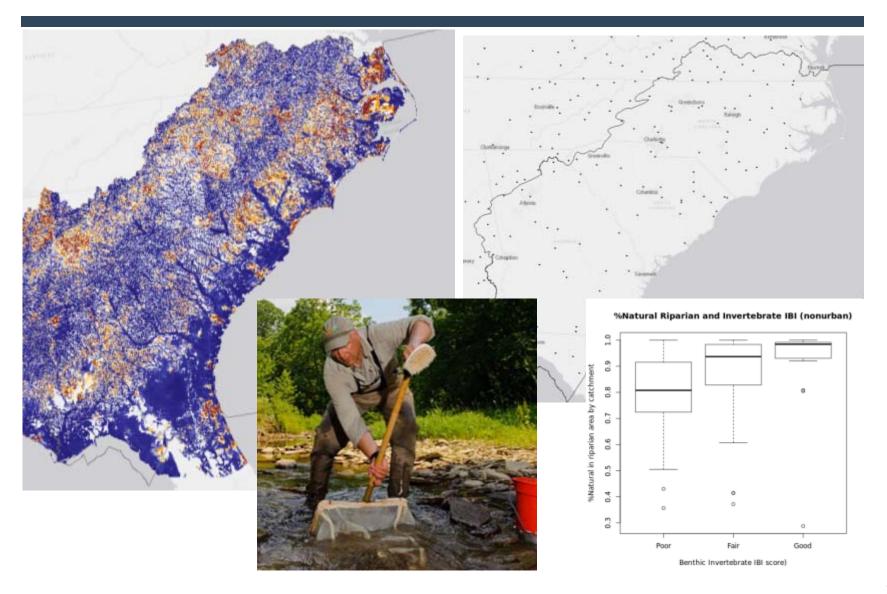

• Integrity of cultural resources

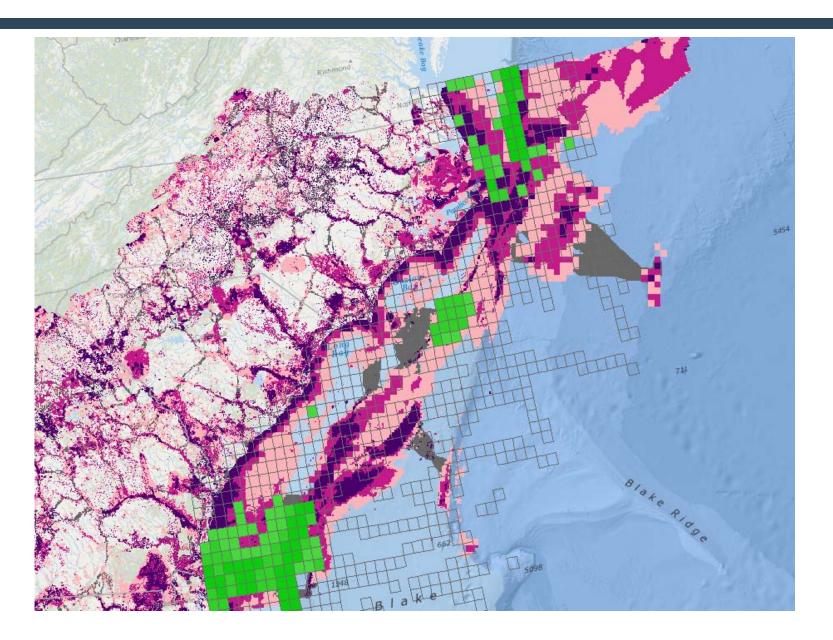

Indicator criteria

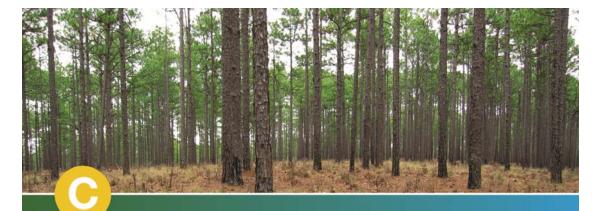

- Ecological
- Practical
- Social

Testing indicators

Spring sea turtle sightings vs Blueprint 2.2

State of the South Atlantic 2015

Understanding our living landscapes

a da

The State of the South Atlantic

State of the South Atlantic

south Atlantic

South Atlantic ecosystem health scores

Overall, the South Atlantic scored a C. Piedmont areas scored the lowest, likely due to impacts from their major urban megaregions. The Marine region scored the highest; however, it did not include fishing impacts. The Coastal Plain scores were in the middle. These scores show that, while the South Atlantic is not completely healthy, there's hope for making future improvements.

North Piedmont: Home to Charlotte, Raleigh, and large areas of upland hardwood forest. People who live and work in urban areas will help decide the future of this region.

South Piedmont: D Home to Atlanta and diverse watersheds draining into the Atlantic and Gulf. Balancing water needs for people and species continues to be a challenge.

North Coastal Plain: O Home to the Outer Banks and extensive estuaries. Sealevel rise is predicted to heavily impact this particularly flat region.

Central Coastal Plain: 1 Home to Wilmington, Myrtle Beach, and large protected wetland areas. Sea-level rise, tourism, and changing agricultural practices continue to influence ecosystem health.

Scoring & level of confidence

Each data-driven indicator score is based on the percent of an area in good condition, according to the best available science. Though all indicators were measured, some scores were omitted to provide a baseline for future comparison. Confidence values are gualitative estimates of uncertainty based on known issues with indicators and data sources.

3

The State of the South Atlantic

turtles. Ocean acidification and increased energy development are major emerging threats.

important migratory fish, whales, and

protected areas.

floodplains.

South Coastal Plain: 😌 Home to Savannah,

Jacksonville, and a network of protected

barrier islands. Partnerships are working

to conserve this region's largest river

Southwest Georgia and extensive

Marine: 1 Home to rich fisheries, deepwater coral, diverse seabirds, and

Gulf Coastal Plain: 10 Home to rural

conservation lands in the Big Bend of

agriculture continue to impact coastal

Florida. Sea-level rise and upstream

A snapshot in time

This assessment evaluates the ecological integrity of the South Atlantic using natural and cultural resource indicators. The indicators are scored across the entire region, for individual ecosystems, and within subregions following watershed and ecoregional boundaries. All indicators are regularly tested and revised, and this first report uses the best metrics available today.

Toward conservation action

Measuring these indicators communicates the status of the region's land and waters, helping develop a more unified vision for thriving ecosystems that support communities and economies. People and organizations are working together on cross-boundary conservation actions through the South Atlantic LCC to improve ecosystem health in the face of unprecedented changes to the natural world.

forested wetland

150 . 508 6/1

🔕 100-80% in good condition 🕕 39-20% in good condition

(B) 79-60% in good condition

O 59-40% in good condition O Not scored; baseline for future

Floodplain forests, pocosins, & bays

These frequently flooded swamp forests occur across the region on both organic soils, like peatland pocosins and Carolina Bays, and mineral soils, like bottomland hardwood and floodplain forests. Though historically drained for timber production and agriculture, intact forested wetlands support ecological diversity and enhance water quality by filtering polluted runoff.

Interpreting the score

Overall, this ecosystem scored a C. Piedmont areas scored the lowest, mostly driven by poor scores on low road density, the bird index, and aquatic connectivity. The North Coastal Plain scored the highest, mostly driven by better scores on low road density and aquatic connectivity. These results underscore the importance of efforts to restore the altered hydrology of forested wetlands in the South Atlantic.

7

Restoring ancient soils

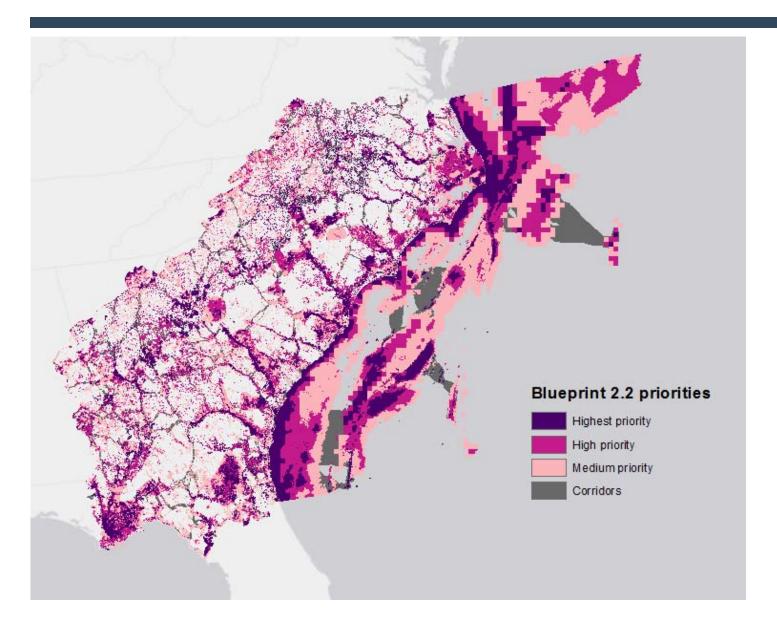

Thirty years ago, the Eastern North Carolina wetlands that now comprise Pocosin Lakes National Wildlife Refuge were drained for peat mining and agriculture. Catastrophic wildfires burned away feet of the resulting dry organic soil. The Refuge has since restored natural hydrology on nearly 30,000 acres, improving habitat quality, protecting against future fires, and sequestering carbon by rebuilding the soil.

The State of the South Atlantic

South Atlantic Conservation Blueprint

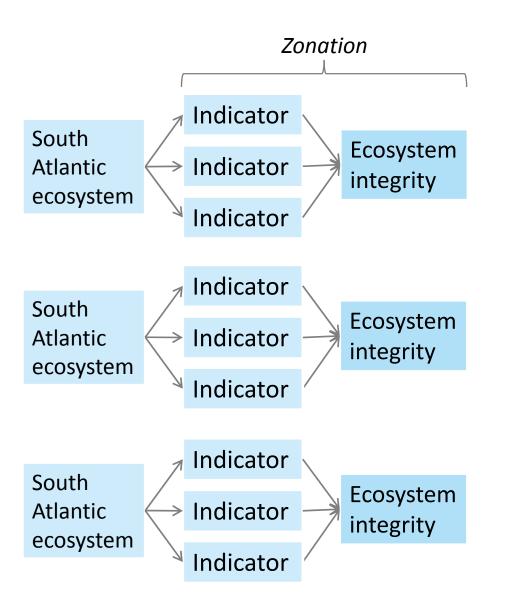

South Atlantic ecosystem

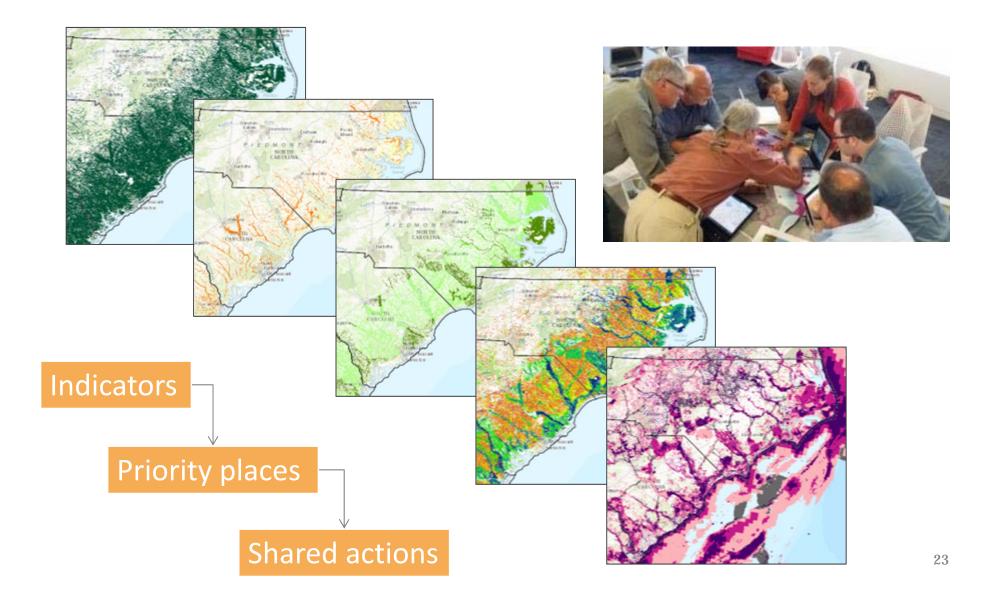

South Atlantic ecosystem

South Atlantic ecosystem

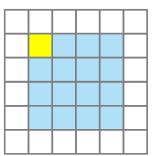

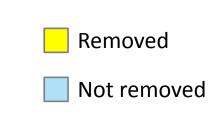

Combining layers

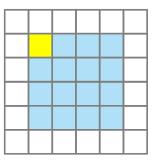

- Objective: Conserve high quality representations of all indicators
- Approach: Zonation iteratively removes pixels that will do the least harm to the full set of indicators

- If all else is equal, removes pixels from layers that are:
 - Closer to the edge

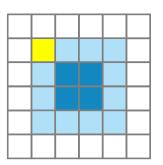

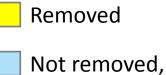

- If all else is equal, removes pixels from layers that are:
 - Closer to the edge

Lower value

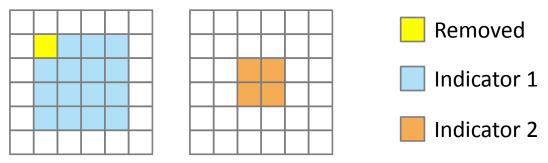

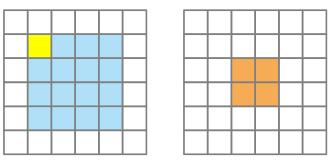

Not removed, lower value

Not removed, higher value

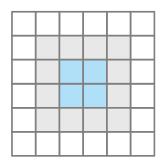

- If all else is equal, removes pixels from layers that have:
 - Larger distributions

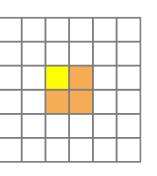

- If all else is equal, removes pixels from layers that have: ٠
 - Larger distributions

– Less loss

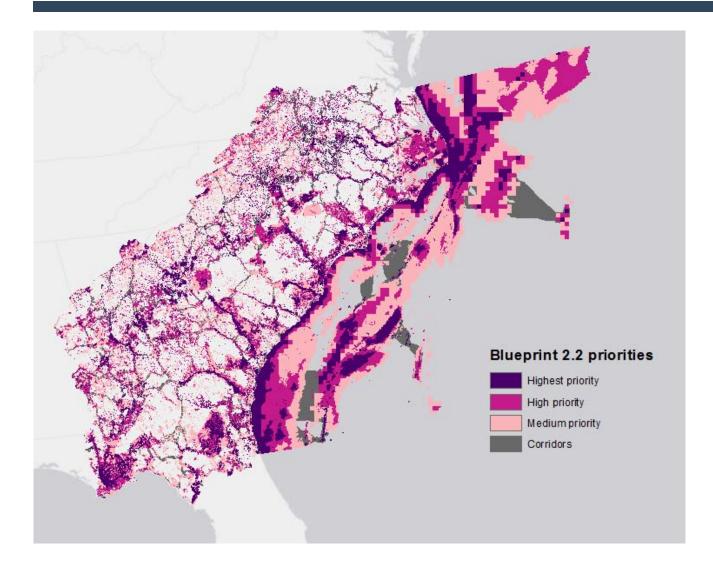

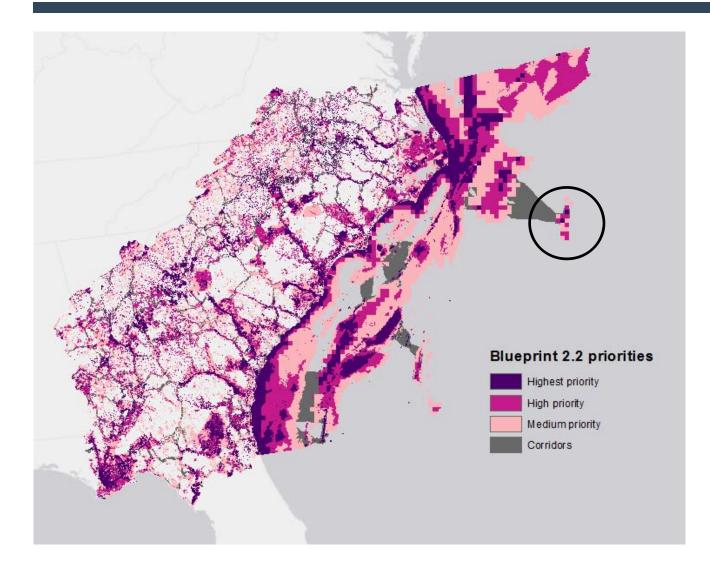

Indicator 2

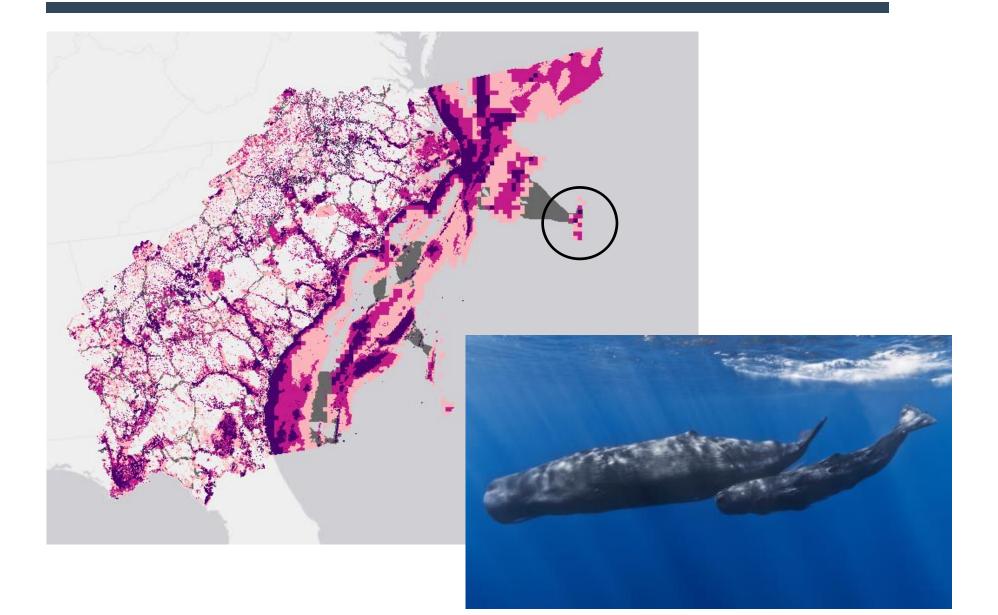

What that means – marine example

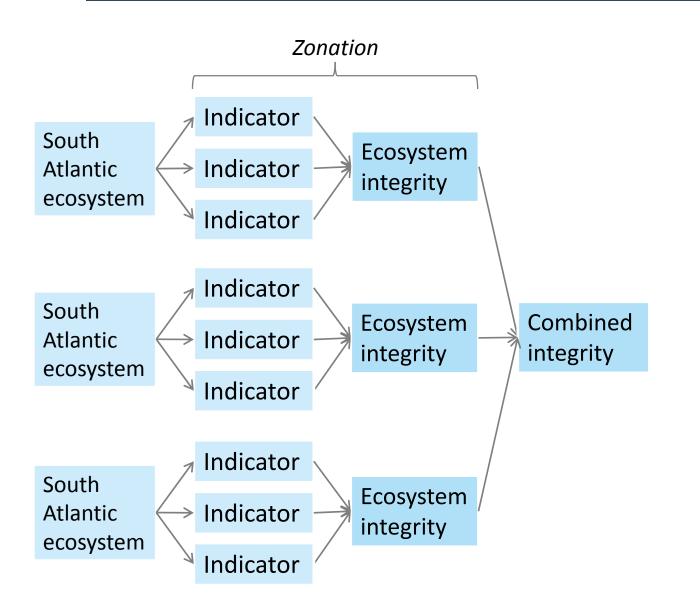

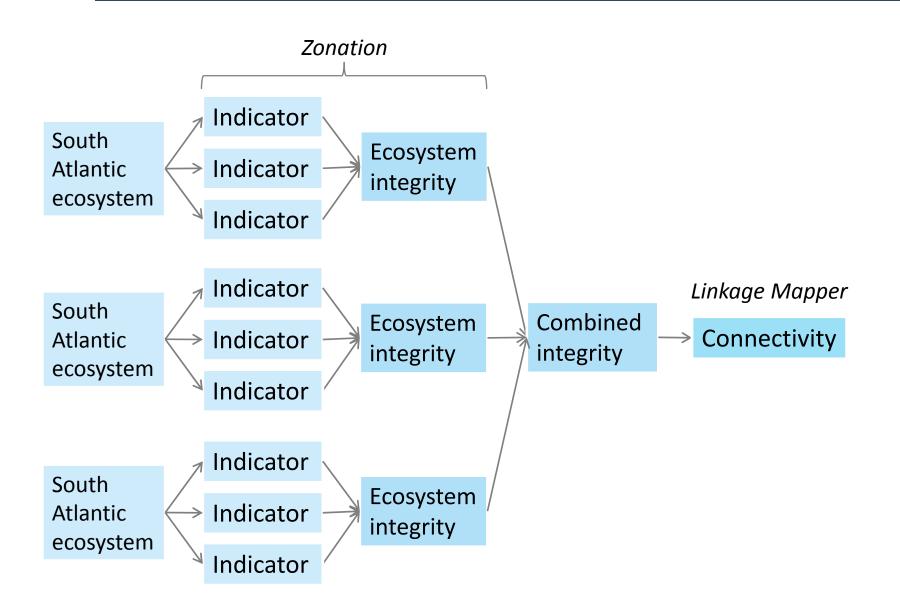

What that means – marine example

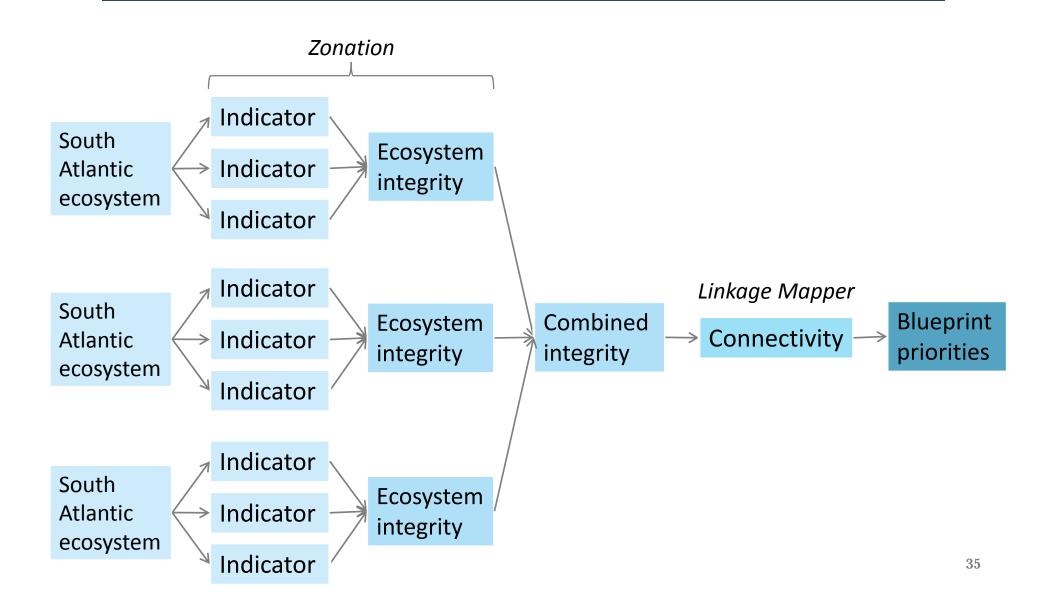

What that means – marine example

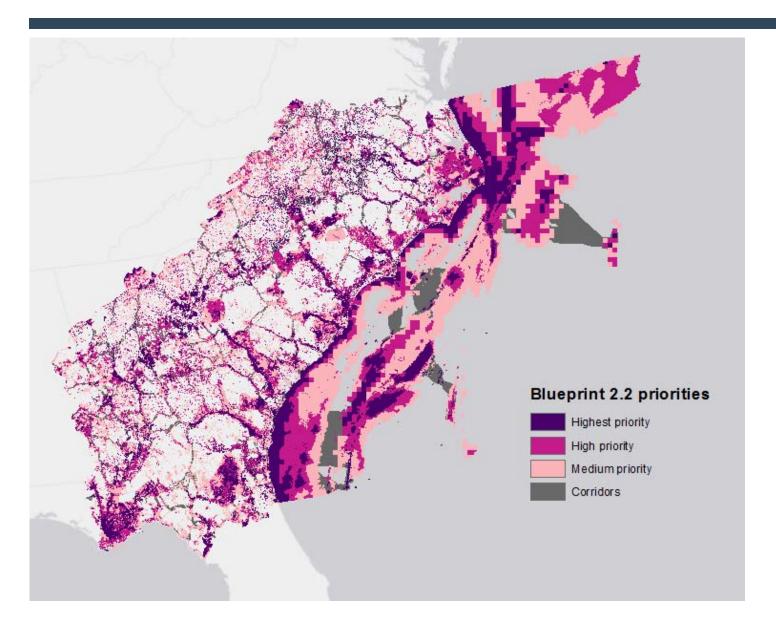

Blueprint priorities

- Each blueprint priority class covers a set amount of the South Atlantic area
- Percentages come from the literature and planning documents seeking to balance conservation and human use

South Atlantic Conservation Blueprint

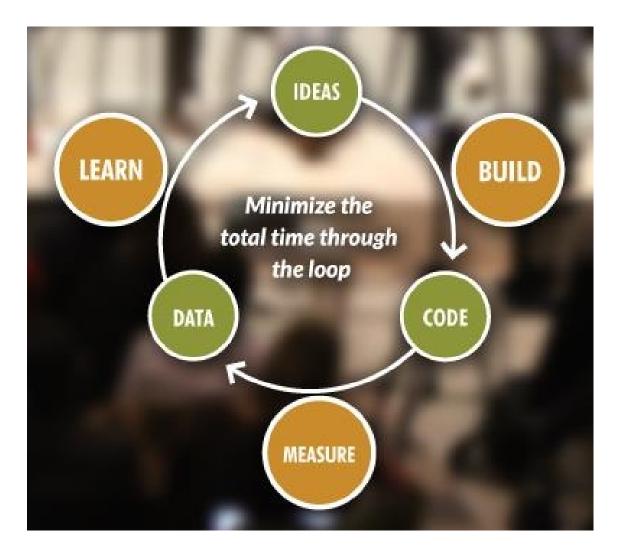

Blueprint major known issues (latest draft)

Blueprint major known issues (latest draft)

- Some aquatic areas, particularly smaller rivers and streams, are overprioritized
- Some aquatic areas important for migratory fish are being under-prioritized in areas far upstream due to issues in the migratory fish connectivity indicator
- Piedmont prairie areas are under-prioritized
- Urban open space is poorly captured in Georgia and South Carolina
- Congaree National Park is under-prioritized. This is likely due to the forested wetland bird indicator under-predicting Swainson's warbler in the area
- The low-urban historic landscapes indicator affects corridors too strongly in some areas

Lean startup

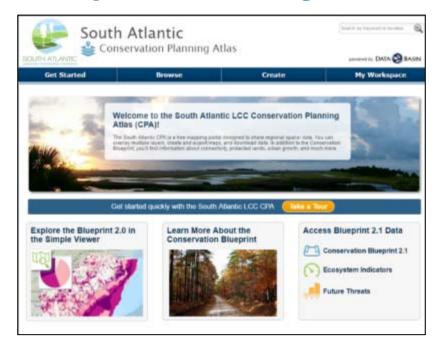

A few improvements in the works

- Finer resolution
- Corridor feasibility using parcel data
- Better models connecting actions and indicators
- Improving indicators for:
 - Estuarine and marine ecosystems
 - Urban areas
 - Historic and other cultural landscapes
- Improving and using targets

Running model has been linked to Marxan & Atlantis Includes an IBM approach

RECENT DEVELOPMENTS IN ECOSPACE

2011 Ecospace had three major limitations

- 1. Unable to represent sub-cell features
- 2. Unable to explicitly incorporate environmental effects on species: "why are the species where they are?"
- 3. Limited facilities to exchange data with the outside world, thus unable to include environmental variability

WHY ARE SPECIES WHERE THEY ARE?
