**SEFSC**

- SRHS provided Wave 1 estimates of headboat landings on April 15, 2015.
  - Wave estimates will now be available on a two-month basis (same as the MRIP waves), made possible via efficiencies gained by electronic reporting and database improvements.
  - This enables managers to more closely monitor ACLs for various species.

**NOAA**

**SEFSC**

- SRHS started development of relational database for headboat electronic logbook verification that will integrate dockside validation and at-sea observer data into one data source. This allows:
  - Existing Oracle database to store, link, merge and conduct dockside and at-sea validation of data.
  - Provide web-based data access for reporting and extraction.
