South Atlantic Fishery Management Council
4055 Faber Place Drive; Suite 201
North Charleston, SC 29405

Award Number **FNA15NMF4410010**

Amendment 49 to the Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region

Proposed action(s):

Revise annual catch limits, sector allocations, commercial minimum size limit, commercial trip limits, and the April spawning closure for greater amberjack; Remove recreational annual catch targets for snapper grouper species.

Summary

Why is the South Atlantic Fishery Management Council considering action?

The South Atlantic Fishery Management Council (Council) is considering action to respond to the most recent stock assessment for South Atlantic greater amberjack (SEDAR 59 2020). The assessment followed a standard approach using data through 2018 and revised estimates for recreational catch from the Marine Recreational Information Program (MRIP) based on the Fishing Effort Survey (FES), which is considered more reliable and robust compared to the Marine Recreational Fisheries Statistics Survey (MRFSS) previously used to derive recreational catch estimates for greater amberjack. The results indicated that South Atlantic greater amberjack are not overfished or experiencing overfishing. Catch and data changes incorporated in the assessment provided information to update the overfishing limit (OFL), acceptable biological catch (ABC), annual optimum yield (OY), and annual catch limits (ACL).

The Council's Scientific and Statistical Committee (SSC) has recommended a new overfishing limit and ABC based on results of the stock assessment, and the total ACL and annual OY must be adjusted accordingly. The Council cannot set the ABC and total ACL above their SSC's ABC recommendation. In addition, sector allocations changes need to be considered following the new stock assessment per the Council's Allocation Review Trigger Policy (see Appendix J) and because of revisions to recreational landing estimates as explained above. The Council is also considering changes to the commercial minimum size limit, the seasonal commercial trip limits, and the April spawning closure in response to public feedback concerning sector equity and fishing efficiency for greater amberjack.

Additionally, the Council is considering action to remove recreational annual catch targets (ACT) for species in the Fishery Management Plan (FMP) for the Snapper Grouper Fishery of the South Atlantic Region (Snapper Grouper FMP). In 2012, the Comprehensive ACL Amendment established ACLs and recreational ACTs (SAFMC 2011d). The latter are intended as a precautionary buffer to account for uncertainty in the recreational catch estimates. While ACTs were developed and established as part of the management process (thus, they must be changed through plan amendments as the ACL changes), these values were not used in developing regulations and were not included in codified regulatory text. Since the Council has not used recreational ACTs to manage the snapper grouper fishery and has accounted for any management uncertainty when setting the ACL, in March 2021, the Council directed staff to include an action in Amendment 49 to the Snapper Grouper FMP that would consider removal of recreational ACTs throughout the Snapper Grouper FMP.

Purpose for Action

The *purpose* of this amendment is to revise the overfishing limit, acceptable biological catch and catch limits for greater amberjack in the South Atlantic based on the results of the latest stock assessment; revise sector allocations, the commercial minimum size limits, commercial trip

limits, and the April spawning closure for greater amberjack; and remove recreational annual catch targets for the Snapper Grouper Fishery Management Plan.

Need for Action

The *need* for this amendment is to ensure catch limits are based on the best scientific information available and to ensure overfishing does not occur for the South Atlantic greater amberjack stock, while increasing social and economic benefits through sustainable and profitable harvest of South Atlantic greater amberjack, consistent with the Magnuson-Stevens Fishery Conservation and Management Act and its National Standards. This amendment is also needed to make administrative efforts more efficient by removing recreational annual catch targets, which are not actively used in management, from the Snapper Grouper Fishery Management Plan.

What are the overfishing limit and acceptable biological catch recommendations for greater amberjack?

The Council’s SSC reviewed the greater amberjack stock assessment (SEDAR 59 2020) at their April 2020 meeting. The assessment followed a standard approach with data through 2018 and used revised estimates for recreational catch from the MRIP based on the FES, which is considered more reliable and robust compared to the MRFSS previously used to derive recreational catch estimates for greater amberjack (Section 1.5). The SSC found that the assessment was conducted using the best scientific information available (BSIA), was adequate for determining stock status and supporting fishing level recommendations, and addressed uncertainty consistent with expectations and available information. The findings of the assessment indicated that the South Atlantic greater amberjack stock is not overfished and not experiencing overfishing.

The SSC provided OFL and ABC recommendations to the Council for 2022 through 2026, until modified (Table S-1). Because these recommendations are based on BSIA, the Council is accepting the recommendations in this FMP amendment and basing the total ACL options in Action 2 on these values. Implementation of this actions in this amendment is expected to occur during the late 2022-2023 or 2023 to 2024 fishing year.

Table S-1. South Atlantic greater amberjack OFL and ABC recommendations, in pounds whole weight (lbs ww), based on projections from SEDAR 59 (2020). The assessment and these projections use recreational data calibrated to the MRIP FES.

Year	OFL Landings (lbs ww)	ABC Landings (lbs ww)
2022	4,615,000	4,380,000
2023	3,283,000	3,233,000
2024	2,839,000	2,818,000
2025	2,719,000	2,699,000
2026	2,691,000	2,669,000

What actions are being proposed in this amendment?

Amendment 49 to the Snapper Grouper FMP proposes the following:

Action 1. Revise the greater amberjack overfishing limit, acceptable biological catch, total annual catch limit, and annual optimum yield

Purpose of Action: The latest stock assessment (SEDAR 59 2020) indicated the stock is not overfished and not experiencing overfishing. Action is needed because the SSC recommended a new ABC based on results of SEDAR 59, and the OFL, ABC, total ACL, and annual OY must be adjusted accordingly. The Council cannot set the total ACL above the SSC’s recommended OFL or ABC.

Preferred Alternative 2.

Revise the overfishing limit and acceptable biological catch and set them equal to the most recent recommendations from the Scientific and Statistical Committee. Revise the total annual catch limit and annual optimum yield for greater amberjack and set them equal to the **recommended** acceptable biological catch. The recommended acceptable biological catch is inclusive of recreational estimates from the Marine Recreational Information Program’s Fishing Effort Survey. The 2026/2027 total annual catch limit and annual optimum yield would remain in place until modified.

Fishing Year	OFL (lbs ww)	ABC (lbs ww)	Annual OY (lbs ww)	Total ACL (lbs ww)
2022/2023	4,615,000	4,380,000	4,380,000	4,380,000
2023/2024	3,283,000	3,233,000	3,233,000	3,233,000
2024/2025	2,839,000	2,818,000	2,818,000	2,818,000
2025/2026	2,719,000	2,699,000	2,699,000	2,699,000
2026/2027+	2,691,000	2,669,000	2,669,000	2,669,000

Action 2. Revise the greater amberjack sector allocations and sector annual catch limits

Purpose of Action: The Council’s Allocations Trigger Policy (Appendix J) states the Council will review sector allocations upon completion of a stock assessment. In addition, recreational landings estimates have been revised to adopt the new MRIP FES methodology. This action allows the Council to consider how to allocate the total ACL between the commercial and recreational sectors from the 2022-2023 fishing year onwards under the revised catch levels.

Preferred Alternative 3. Allocate 65.00% of the revised total annual catch limit for greater amberjack to the recreational sector and 35.00% of the revised total annual catch limit for greater amberjack to the commercial sector.

Action 3. Reduce the commercial minimum size limit for greater amberjack

Purpose of Action: In response to public feedback gathered during scoping of this amendment and given the current stock status, the Council is considering changes to minimum size limits to reduce the difference between the current recreational (28 inches fork length) and commercial

(36 inches fork length) size limits. This action is intended to increase fairness and equity between sectors and commercial fishing efficiency.

Preferred Alternative 3. Reduce the commercial minimum size limit to 32 inches fork length.

Action 4. Increase the Season 2 commercial trip limit for greater amberjack

Purpose of Action: In response to public feedback gathered during scoping of this amendment and given the current stock status, the Council is considering increasing the Season 2 (September-February) commercial trip limit (1,000 lbs ww or gw) to make it equal to the Season 1 (March-August) commercial trip limit (1,200 lbs ww or gw). This action is intended to allow some increase to harvest of a stock that is not overfished and above its reference biomass level.

Preferred Alternative 3. Modify the September 1 through the end of February (Season 2) commercial trip limit for greater amberjack to be:

Preferred Sub-Alternative 3a. 1,200 lbs ww or gw.

Action 5. Revise the April spawning closure for greater amberjack

Purpose of Action: In response to public feedback gathered during scoping of this amendment, the Council is considering revising the current April spawning closure for the commercial sector to be a closure of both the recreational and commercial sectors in April. This action is intended to increase fairness and equity between sectors.

Preferred Alternative 2. Specify during April each year, no person may sell, purchase, harvest, or possess a greater amberjack from the South Atlantic exclusive economic zone and the harvest and possession limits are zero. This closure would apply to both the recreational and commercial sectors.

Action 6. Remove recreational annual catch targets from the Snapper Grouper Fishery Management Plan

Purpose of Action: Recreational ACTs are not currently used in management of snapper grouper species, but are included as part of the FMP and must be updated when the recreational ACL changes. This action is intended to reduce administrative burden while not significantly altering effective management of the snapper grouper fishery.

Preferred Alternative 2. Remove recreational annual catch targets for species managed under the Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region.

Chapter 1. Introduction

1.1. What actions are being proposed in this plan amendment?

The proposed actions in this plan amendment would revise the OFL (overfishing limit), acceptable biological catch (ABC), annual catch limits (ACL), annual optimum yield (OY), and sector allocations for greater amberjack in the South Atlantic based on the results of the latest stock assessment. Other actions would modify the commercial minimum size limit, the commercial season 1 and season 2 trip limits, and the April spawning closure for greater amberjack. The plan amendment would also remove recreational annual catch targets (ACT) for snapper grouper species, which are not actively being used in the management of species under the Fishery Management Plan (FMP) for the Snapper Grouper Fishery of the South Atlantic Region (Snapper Grouper FMP).

South Atlantic Fishery Management Council

- Responsible for conservation and management of fish stocks in the South Atlantic Region.
- Consists of 13 voting members who are appointed by the Secretary of Commerce, 1 representative from each of the 4 South Atlantic states, the Southeast Regional Administrator of NMFS, and 4 non-voting members.
- Responsible for developing fishery management plans and amendments under the Magnuson-Stevens Act; recommends actions to NMFS for implementation.
- Management area is from 3 to 200 nautical miles off the coasts of North Carolina, South Carolina, Georgia, and east Florida through Key West, except for mackerel which is from New York to Florida, and dolphin and wahoo, which is from Maine to Florida.

1.2. Who is proposing the amendment?

The South Atlantic Fishery Management Council (Council) is responsible for managing fish stocks in the South Atlantic Region. The Council develops the amendment and sends it to the National Marine Fisheries Service (NMFS), who decides whether to approve the amendment and publish a rule to implement the amendment on behalf of the Secretary of Commerce. NMFS is an agency of the National Oceanic and Atmospheric Administration within the Department of Commerce. Guided by the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), the Council works with NMFS, other partners, and stakeholders to assess the status of fish stocks, specify catch limits, reduce bycatch, and ensure compliance with fisheries regulations.

The Council and NMFS are also responsible for making this amendment available for public comment. The draft environmental assessment (EA) is combined with the amendment and will be made available to the public during the scoping process, public hearings, and in Council meeting briefing books. The final EA and amendment will be made available for public comment during the proposed rule stage of the rulemaking process. The final EA and amendment will be found on the Council's website at <http://www.safmc.net>.

1.3. Where is the project located?

Management of the federal snapper grouper fishery located off the southeastern United States (South Atlantic) in the 3-200 nautical miles U.S. exclusive economic zone (EEZ) is conducted under the Snapper Grouper FMP (SAFMC 1983) (Figure 1.3.1.1). There are fifty-five species managed by the Council under the Snapper Grouper FMP.

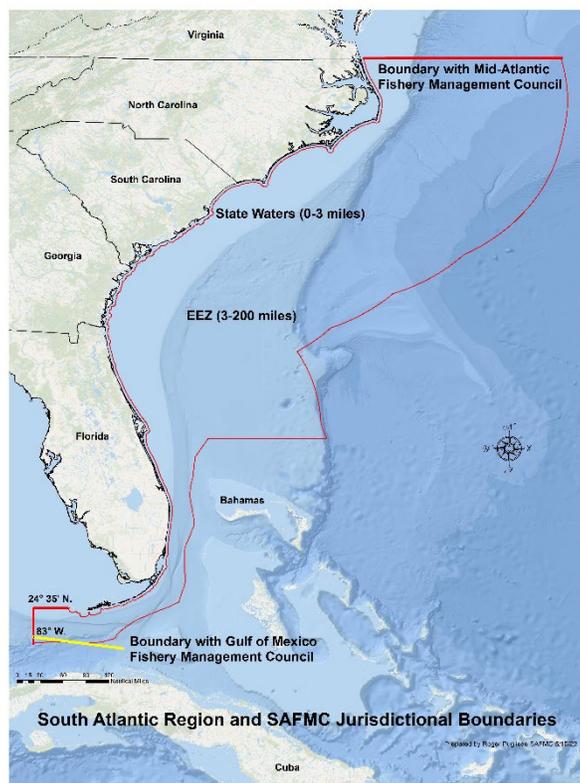

Figure 1.3.1. Jurisdictional boundaries of the Council.

1.4. Why is the Council considering action (Purpose and Need statements)?

Purpose: The *purpose* of this amendment is to revise the overfishing limit, acceptable biological catch and catch limits for greater amberjack in the South Atlantic based on the results of the latest stock assessment; revise sector allocations, the commercial minimum size limits, the commercial trip limits, and the April spawning closure for greater amberjack; and remove recreational annual catch targets for the Snapper Grouper Fishery Management Plan.

Need: The *need* for this amendment is to ensure catch limits are based on the best scientific information available and to ensure overfishing does not occur for the South Atlantic greater amberjack stock, while increasing social and economic benefits through sustainable and profitable harvest of South Atlantic greater amberjack, consistent with the Magnuson-Stevens Fishery Conservation and Management Act and its National Standards. This amendment is also needed to make administrative efforts more efficient by removing recreational annual catch

targets, which are not actively used in management, from the Snapper Grouper Fishery Management Plan.

Background

The Council is considering action to respond to the most recent stock assessment for South Atlantic greater amberjack (SEDAR 59 2020). The assessment followed a standard approach using data through 2018 and revised estimates for recreational catch from the Marine Recreational Information Program (MRIP) based on the mail-based Fishing Effort Survey (FES), which is considered more reliable and robust compared to the Marine Recreational Fisheries Statistics Survey (MRFSS) previously used to derive recreational catch estimates for greater amberjack. The assessment results indicated that South Atlantic greater amberjack are not overfished or experiencing overfishing (Table 1.4.1). Updated catch and data changes incorporated in the assessment provided information to update the OFL, ABC, annual OY, and ACLs.

Table 1.4.1. South Atlantic greater amberjack stock status criteria recommendations based on the results of SEDAR 59 (2020).

Criteria	Deterministic	Probabilistic
Overfished evaluation (SSB/SSB _{MSY})	2.10	2.39
Overfishing evaluation	0.40	0.28
MFMT (F _{MSY})	0.69	1.07
SSB _{MSY} (mt mature female biomass)	3,291	2,642
MSST (mt mature female biomass)	2,468	2,066
MSY (1000 lbs.)	2,342	2,474

During public scoping of this amendment and initial feedback from the Snapper Grouper Advisory Panel (April 2021), the Council received comments requesting consideration of changes to the commercial minimum size limit, commercial trip limits, and April spawning closure. The Council is considering a reduction of the commercial minimum size limit to reduce the difference in size limits between sectors, which would increase fairness and equity between sectors and commercial fishing efficiency. The Council is considering increases to the commercial trip limits to allow some increase in harvest of a stock that is not overfished and above its reference biomass level. The Council is also considering changes to the April spawning closure such that both sectors would have similar access or restrictions during April. This action is intended to increase fairness and equity between sectors, as well.

Additionally, the Council is considering an action to remove recreational ACTs from species in the Snapper Grouper FMP. In 2012, the Comprehensive ACL Amendment established ACLs and recreational ACTs (SAFMC 2011d). The latter are intended as a precautionary buffer to account for uncertainty in the recreational catch estimates. While ACTs were developed and established as part of the management process (thus, they must be changed through plan amendments as the ACL changes), these values were not used in developing regulations and were not included in codified regulatory text. Since the Council has not used the ACT to manage the snapper grouper fishery and has accounted for any management uncertainty when setting the ACL, in March 2021, the Council directed staff to include an action in Amendment 49 to the

Snapper Grouper FMP that would consider removal of recreational ACTs throughout the Snapper Grouper FMP.

1.5. How has recreational data collection changed in the southeast?

MRFSS was created in 1979 by NMFS. The program included the Access Point Angler Intercept Survey (APAIS), which consists of onsite interviews at marinas and other points where recreational anglers fish, to determine catch. MRFSS also included the Coastal Household Telephone Survey (CHTS), which used random-digit dialing of homes in coastal counties to contact anglers to determine fishing effort. In 2000, the For-Hire Survey (FHS) was implemented to incorporate for-hire effort due to lack of coverage of charter boat anglers by the CHTS. The FHS used a directory of all known charter boats and a weekly telephone sample of the charter boat operators to obtain effort information.

MRIP replaced MRFSS in 2013 to meet increasing demand for more precise, accurate, and timely recreational catch estimates. A description of MRIP may be found <https://www.fisheries.noaa.gov/recreational-fishing-data/about-marine-recreational-information-program/>. MRIP is a more scientifically sound methodology for estimating catch because it reduces some sources of potential bias as compared to MRFSS, resulting in more accurate catch estimates. Specifically, CHTS was improved to better estimate private angling effort. Instead of random telephone calls, MRIP-CHTS used targeted calls to anglers registered with a federal or state saltwater fishing registry. MRIP also incorporated a new survey design for APAIS in 2013. This new design addressed concerns regarding the validity of the survey approach, specifically that trips recorded during a given time period are representative of trips for a full day (Foster et al. 2018). The more complete temporal coverage with the new survey design provides for consistent increases or decreases in APAIS angler catch rate statistics, which are used in stock assessments and management, for at least some species (NMFS 2021a).

For greater amberjack, recreational catch estimates from MRIP were back-calibrated to reflect the scale of MRFSS estimates because while MRFSS estimation methods were being improved ahead of the transition to MRIP, the SEDAR 15 stock assessment of greater amberjack (2008) was already underway using MRFSS data. Therefore, the results of that assessment were based on MRFSS as the recreational catch estimation method.

MRIP transitioned from the legacy CHTS to FES beginning in 2015, and in 2018, the FES replaced the CHTS as the method MRIP uses to estimate fishing effort. A detailed explanation and description of the changes may be found at <https://www.fisheries.noaa.gov/recreational-fishing-data/effort-survey-improvements>. Both survey methods collect data needed to estimate marine recreational fishing effort (number of fishing trips) by shore and private/rental boat anglers on the Atlantic and Gulf coasts. The new mail-based FES uses angler license and registration information as one way to identify and contact anglers (supplemented with data from the U.S. Postal Service, which includes virtually all U.S. households). Because the FES and CHTS are substantially different, the catch estimates produced from the data obtained through the two methods are not directly comparable, i.e., an estimated number of fish harvested by one method is not equivalent to the same estimated number of fish harvested by the other method. Consequently, NMFS conducted side-by-side testing of the two methods from 2015 to 2018 and

developed calibration procedures to convert the historical catch estimates (MRFSS, MRIP-CHTS, MRIP-APAIS [collectively MRFSS]) into MRIP-FES. In general, landings estimates are higher using the MRIP-FES as compared to the MRFSS estimates. This is because the FES is designed to more accurately measure fishing activity than the CHTS, not because there was a sudden rise in fishing effort. NMFS developed a calibration model to adjust historic effort estimates so that they can be accurately compared to new estimates from the FES. The new effort estimates alone do not lead to definitive conclusions about stock size or status in the past or at current. NMFS determined that the MRIP-FES data, when fully calibrated to ensure comparability among years and across states, produced the best available data for use in stock assessments and management (NMFS 2021a).

For monitoring the greater amberjack recreational catches and ACL, which were still being evaluated using estimates back-calibrated to MRFSS, catches from 2018 on were estimated using the current MRIP-FES then back-calibrated to reflect the scale of MRFSS estimates. The SEDAR 59 stock assessment of greater amberjack (2020) used recreational catch estimates collected through and calibrated to MRIP-FES. Therefore, the recreational catch levels and ACL will be evaluated and monitored through the MRIP-FES upon implementation of this amendment.

1.6. Are these actions within the bounds of scientific recommendations?

The SSC reviewed SEDAR 59 (2020) during their April 2020 meeting and found that the assessment addressed the terms of reference appropriately, was conducted using the best scientific information available (BSIA), is adequate for determining stock status and supporting fishing level recommendations, and the methods to address uncertainty were consistent with expectations and available information. The SSC recommended revising the OFL based on projections under a fishing mortality rate that would produce maximum sustainable yield ($F = F_{MSY}$) and applied the ABC control rule to recommend the ABC for greater amberjack. These recommendations were updated using additional projections from the Southeast Fisheries Science Center (SEFSC) that applied the new recommended OFL and ABC from 2022 through 2026 (Table 1.6.1). Discards were projected as separate values from the landings shown in Table 1.6.1. The OFL and ABC recommendations are based on BSIA; therefore, the Council is accepting the recommendations in this Snapper Grouper FMP amendment and basing the total ACL options in Action 1 on these values.

The fishing year for greater amberjack runs from March 1 through the end of February. The stock assessment results are provided in calendar years because of changes to the fishing year that have happened throughout the stock's management history. Therefore, the SSC's recommendations based on the stock assessment are also in calendar years. When developing options for ACLs, the annual ABC for each calendar year was considered to apply to the fishing year that started in March of that calendar year. This was done to align ABC projections with the catch monitoring timeframe applied for this stock and because the majority of the fishing year occurs within the first of the two partial calendar years it spans. For example, the 2022 ABC from Table 1.6.1 would be used to define the ACL for the March 2022-February 2023

fishing year. However, the actions in this amendment are expected to be implemented during the late 2022-2023 or 2023-2024 fishing year.

Table 1.6.1. South Atlantic greater amberjack OFL and ABC recommendations, in pounds whole weight (lbs ww), based on projections from SEDAR 59 (2020). The assessment and these projections use recreational data calibrated to the MRIP FES.

Year	OFL (lbs ww)	ABC (lbs ww)
2022	4,615,000	4,380,000
2023	3,283,000	3,233,000
2024	2,839,000	2,818,000
2025	2,719,000	2,699,000
2026	2,691,000	2,669,000

1.7. How were the ACL alternatives determined?

The total ACL alternatives (Action 1) were determined based on ABCs recommended by the SSC, based on the results of SEDAR 59 (2020). Considered alternatives are based on 100% (**Preferred Alternative 2**), 90% (**Alternative 3**), and 80% (**Alternative 4**) of the recommended annual ABCs. The total ACL may not exceed the ABC recommended by the SSC for a given year.

The current allocation percentages used to determine commercial and recreational ACLs from the total ACL are based on an allocation formula that takes a weighted average of long-term (1986-2008) and short-term (2006-2008) proportions of landings from each sector. These time periods were chosen because they did not include currently required sector ACLs that limit annual harvest. The most recent stock assessment at that time (SEDAR 15) used MRFSS estimates of recreational catch. Therefore, the ACLs and the recreational catch estimates used to estimate allocation percentages were based on MRFSS as well. Although MRFSS/MRIP estimation methods changed over time (as described in Section 1.5), estimates of recreational catch for greater amberjack were back-calibrated to reflect the scale of MRFSS estimates so the annually monitored recreational catch could be comparable to the ACL. In 2018, MRIP fully transitioned its estimation of recreational effort to the FES as discussed above. Following implementation of this amendment, recreational catch estimation and monitoring of the ACL will be done using MRIP-FES. Alternatives for allocation percentages (Action 2) are based on applying the current allocation formula to landings data that include MRIP-FES recreational estimates (**Alternative 2**) and an approximate middle allocation between percentages resulting from original and re-application of the allocation formula (**Preferred Alternative 3**). Additional alternatives (**Alternative 4** and **Alternative 5**) were included to consider the growing commercial importance of greater amberjack and ACL reductions to other commercially important snapper grouper species.

1.8. What is the history of management for the greater amberjack?

Snapper grouper regulations in the South Atlantic were first implemented in 1983. Below are amendments to the Snapper Grouper FMP addressing South Atlantic greater amberjack catch

levels and management measures, as well as recreational ACTs. An application providing an overview of the South Atlantic greater amberjack stock, including a more complete management history, landings, and assessment information is available here: https://safmc-shinyapps.shinyapps.io/SA_FisheryDataGreaterAmberjack/.

Snapper Grouper FMP (1983)

The FMP included provisions to prevent growth overfishing in thirteen species in the snapper grouper complex and established a procedure for preventing overfishing in other species; established minimum size limits for red snapper, yellowtail snapper, red grouper, Nassau grouper, and black sea bass; established a 4-inch trawl mesh size to achieve a 12-inch total length (TL) minimum size limit for vermilion snapper; and included additional harvest and gear limitations.

Amendment 4 (1991)

The amendment prohibited the use of various gear, including fish traps, the use of bottom longlines for wreckfish, and powerheads in special management zones off South Carolina; defined overfishing/overfished and established rebuilding timeframe: greater amberjack ≤ 10 years (year 1 = 1991); established bag limits (3 recreational greater amberjack per person per day) and minimum size limits for several species (28-inch fork length [FL] minimum size limit for recreational greater amberjack; 36-inch FL or 28-inch core length minimum size limit for commercial greater amberjack); required permits (commercial and for-hire) and specified data collection regulations; and required that all snapper grouper species possessed in the South Atlantic EEZ must have heads and fins intact through landing.

Amendment 9 (1998; resubmitted in 1999)

The amendment established a 1-fish recreational bag limit for greater amberjack, a commercial greater amberjack quota of 1,169,931 pounds, and started the fishing year for greater amberjack on May 1. The amendment also prohibited purchase, sale, or possession of more than one greater amberjack per person during April and prohibited coring. The resubmitted version of this amendment additionally established a 1,000-pound commercial trip limit for greater amberjack.

Amendment 11 (1998)

The amendment amended the Snapper Grouper FMP to make definitions of maximum sustainable yield, OY, overfishing, and overfished consistent with National Standard Guidelines. Amendment 11 also identified and defined fishing communities, addressed bycatch management measures, and defined the greater amberjack F_{msy} proxy as F30% static spawning potential ratio.

Regulatory Amendment 9 (2010)

The amendment increased the commercial trip limit for greater amberjack to 1,200 lbs.

Amendment 25/Comprehensive Annual Catch Limit Amendment (2011)

The amendment established ABC control rules and ABCs, ACLs, recreational ACTs, and accountability measures (AM) for species not undergoing overfishing (including greater amberjack). The values established by this amendment for greater amberjack were as follows: ABC = 1,968,000 lbs ww; commercial ACL = 800,163 lbs ww; recreational ACL = 1,167,837 lbs ww; and recreational ACT = 992,662 lbs ww.

DRAFT DOCUMENT

Regulatory Amendment 14 (2014)

The amendment modified the commercial and recreational fishing year for greater amberjack to March-February.

Regulatory Amendment 21 (2014)

The amendment modified the definition of the overfished threshold for several species, including greater amberjack.

Amendment 34/Generic AM Amendment (2015)

The amendment modified AMs for greater amberjack.

Vision Blueprint Commercial Regulatory Amendment 27 (2019)

The amendment established split seasons for the commercial sector for greater amberjack, allocated the commercial ACL 60/40 between the two seasons, and established trip limits for each commercial season (Season 1:1,200 pounds; Season 2:1,000 pounds).

Chapter 2. Proposed Actions and Alternatives

2.1. Action 1. Revise the greater amberjack overfishing limit, acceptable biological catch, total annual catch limit, and annual optimum yield

Note: Implementation of the actions in this amendment (including revised overfishing limit (OFL), acceptable biological catch (ABC), and annual catch limits (ACLs)) are expected to occur in the late 2022-2023 or early 2023-2024 fishing year.

2.1.1. Alternatives

Alternative 1 (No Action). The current overfishing limit for greater amberjack is 2,005,000 pounds whole weight. The total annual catch limit and annual optimum yield for greater amberjack are equal to the **current** acceptable biological catch (1,968,001 pounds whole weight). The current acceptable biological catch is inclusive of recreational estimates from the Marine Recreational Information Program’s Marine Recreational Fishery Statistics Survey.

Preferred Alternative 2. Revise the overfishing limit and acceptable biological catch and set them equal to the most recent recommendations from the Scientific and Statistical Committee. Revise the total annual catch limit and annual optimum yield for greater amberjack and set them equal to the **recommended** acceptable biological catch. The recommended acceptable biological catch is inclusive of recreational estimates from the Marine Recreational Information Program’s Fishing Effort Survey. The 2026/2027 total annual catch limit and annual optimum yield would remain in place until modified.

Fishing Year	OFL (lbs ww)	ABC (lbs ww)	Annual OY (lbs ww)	Total ACL (lbs ww)
2022/2023	4,615,000	4,380,000	4,380,000	4,380,000
2023/2024	3,283,000	3,233,000	3,233,000	3,233,000
2024/2025	2,839,000	2,818,000	2,818,000	2,818,000
2025/2026	2,719,000	2,699,000	2,699,000	2,699,000
2026/2027+	2,691,000	2,669,000	2,669,000	2,669,000

Alternative 3. Revise the overfishing limit and acceptable biological catch and set them equal to the most recent recommendations from the Scientific and Statistical Committee. Revise the total annual catch limit and annual optimum yield for greater amberjack and set them equal to 90% of the **recommended** acceptable biological catch. The recommended acceptable biological catch is inclusive of recreational estimates from the Marine Recreational Information Program’s Fishing Effort Survey. The 2026/2027 total annual catch limit and annual optimum yield would remain in place until modified.

Fishing Year	OFL (lbs ww)	ABC (lbs ww)	Annual OY (lbs ww)	Total ACL (lbs ww)
2022/2023	4,615,000	4,380,000	3,942,000	3,942,000
2023/2024	3,283,000	3,233,000	2,909,700	2,909,700
2024/2025	2,839,000	2,818,000	2,536,200	2,536,200
2025/2026	2,719,000	2,699,000	2,429,100	2,429,100
2026/2027+	2,691,000	2,669,000	2,402,100	2,402,100

Alternative 4. Revise the overfishing limit and acceptable biological catch and set them equal to the most recent recommendations from the Scientific and Statistical Committee. Revise the total annual catch limit and annual optimum yield for greater amberjack and set them equal to 80% of the **recommended** acceptable biological catch. The recommended acceptable biological catch is inclusive of recreational estimates from the Marine Recreational Information Program’s Fishing Effort Survey. The 2026/2027 total annual catch limit and annual optimum yield would remain in place until modified.

Fishing Year	OFL (lbs ww)	ABC (lbs ww)	Annual OY (lbs ww)	Total ACL (lbs ww)
2022/2023	4,615,000	4,380,000	3,504,000	3,504,000
2023/2024	3,283,000	3,233,000	2,586,400	2,586,400
2024/2025	2,839,000	2,818,000	2,254,400	2,254,400
2025/2026	2,719,000	2,699,000	2,159,200	2,159,200
2026/2027+	2,691,000	2,669,000	2,135,200	2,135,200

Discussion

The revised ACLs proposed in **Preferred Alternative 2, Alternative 3, and Alternative 4** are based on the Scientific and Statistical Committee’s (SSC) new OFL and ABC recommendations that were developed following the SEDAR 59 stock assessment (2020) (Table 1.6.1). SEDAR 59 (2020) indicates that the increase in the ABC recommended by the SSC is a function of both an improved condition of the stock and the change in the recreational survey from MRFSS to MRIP FES; therefore, the total ACL can be increased without having negative effects on the sustainability of the stock.

Per the guidance provided at 50 CFR § 600.310(f)(4)(iv), the South Atlantic Fishery Management Council (Council) has chosen to specify optimum yield (OY) for greater amberjack on an annual basis and set it equal to the ACL.

Alternative 1 (No Action) would retain the current OFL, ABC, total ACL, and annual OY implemented through Amendment 25 (Comprehensive ACL Amendment) to the Fishery

Management Plan (FMP) for the Snapper Grouper Fishery of the South Atlantic Region (Snapper Grouper FMP; SAFMC 2011d). **Preferred Alternative 2** is based on the Council's SSC's recommendations and would set the ACL equal to the ABC. **Alternatives 3** and **4** would add a 10% and 20% buffer, respectively, between the total ACL and the ABC. For **Preferred Alternative 2** through **Alternative 4**, the ACL in the final year of projections recommended by the SSC (2026-2027) would remain in place until modified by a future amendment.

For **Preferred Alternative 2** through **Alternative 4**, proposed ACLs are based on recreational data from the Marine Recreational Information Program (MRIP) that is calibrated to the Fishing Effort Survey (FES). Future recreational catches under these limits would be monitored by MRIP using the FES without any back-calibration to the MRFSS scale (as is done currently to estimate recreational catches and compare to the ACL). MRIP-FES catch estimates for greater amberjack are greater than those scaled to MRFSS, so catches as currently monitored are not comparable to limits in **Alternatives 2 (Preferred)** through **4**. For a representation of recent harvests that is comparable to ACLs developed using MRIP FES, average annual total landings of greater amberjack from 2015-2019 calculated using MRIP FES estimates for the recreational sector were 2.73 million lbs ww. A more comprehensive analysis of predicted landings and ACLs considered in Action 1 is included in [Appendix F](#).

2.1.2. Comparison of Alternatives

Alternative 1 (No Action) is not a viable alternative because it would retain the current OFL, ABC and total ACL for greater amberjack (equal to the current ABC), which is no longer based on the best scientific information available (BSIA). Therefore, **Alternative 1 (No Action)** is not included in further comparisons.

Alternatives 3 and **4** would have greater long-term positive biological effects than **Preferred Alternative 2** because they would create a buffer between the ACL/annual OY and ABC, with **Alternative 4** setting the most conservative buffer at 80% of the ABC. When totaling the annual ACL from 2022 through 2027, **Alternative 4** has the lowest cumulative ACL which is expected to have the greatest long-term biological benefits to the stock, followed by **Alternative 3**, and **Preferred Alternative 2**.

Total ACLs that allow for more fish to be landed can result in increased positive economic effects if harvest increases without notable long-term effects on the health of a stock. The ACL does not directly impact the fishery for a species unless harvest changes, fishing behavior changes, or the ACL is exceeded, thereby potentially triggering restrictive accountability measures (AM) being triggered that would lead to short-term negative economic effects. Nevertheless, ACLs set above observed harvest levels do create a gap between the ACL and typical landings that may be utilized in years of exceptional abundance or accessibility to a species, thus providing the opportunity for increased landings and a reduced likelihood of triggering restrictive AMs. As such, there are potential economic benefits from ACLs that allow for such a gap. Thus, under this notion, from a short-term economic perspective under initial implementation, **Preferred Alternative 2** would have the highest potential net economic benefits, followed by **Alternative 3** and **Alternative 4**.

DRAFT DOCUMENT

In general, a higher ACL would lower the chance of triggering a recreational AM and result in the lowest level of negative effects on the recreational sector. Additionally, higher ACLs may provide opportunity for commercial and recreational fishermen to expand their harvest providing social benefits associated with increased income to fishing businesses within the community and higher trip satisfaction. Among the action alternatives, **Preferred Alternative 2** would be the most beneficial for fishermen, followed by **Alternative 3** and **Alternative 4**.

Alternatives 2 (Preferred), 3, and 4 would not result in significant administrative cost or time burdens other than notifying fishery participants of the change in the sector ACLs and continued monitoring of the sector ACLs.

2.2. Action 2. Revise the greater amberjack sector allocations and sector annual catch limits

2.2.1. Alternatives

Note: The revised sector annual catch limits in Alternatives 1 (No Action) through 5 reflect the revised total annual catch limit in Preferred Alternative 2 of Action 1. The revised total annual catch limit in Preferred Alternative 2 of Action 1 is based on catch data used in SEDAR 59 (2020), including recreational catch estimates from the Marine Recreational Information Program using its Fishing Effort Survey rather than recreational catch estimates scaled to the former Marine Recreational Fisheries Statistics Survey.

Alternative 1 (No Action). Retain the current recreational sector and commercial sector allocations as 59.34% and 40.66%, respectively, of the revised total annual catch limit for greater amberjack.

Alternative 2. Allocate 70.16% of the revised total annual catch limit for greater amberjack to the recreational sector and 29.84% of the revised total annual catch limit for greater amberjack to the commercial sector.

Preferred Alternative 3. Allocate 65.00% of the revised total annual catch limit for greater amberjack to the recreational sector and 35.00% of the revised total annual catch limit for greater amberjack to the commercial sector.

Alternative 4. Allocate 55.00% of the revised total annual catch limit for greater amberjack to the recreational sector and 45.00% of the revised total annual catch limit for greater amberjack to the commercial sector.

Alternative 5. Allocate 50.00% of the revised total annual catch limit for greater amberjack to the recreational sector and 50.00% of the revised total annual catch limit for greater amberjack to the commercial sector.

Discussion

The allocation percentages in **Alternative 1 (No Action)** were originally derived by applying the formula of sector ACL = ((mean landings 2006-2008)*0.5) + ((mean landings 1986-2008)*0.5) to the landings dataset used in the Comprehensive ACL Amendment (Amendment 25 to the Snapper Grouper FMP (SAFMC 2011)), which included recreational estimates from the Marine Recreational Fisheries Statistics Survey. Future recreational catches under **Alternative 1 (No Action)**, as well as the rest of the Action 2 alternatives, would be monitored via the MRIP FES. **Alternative 1 (No Action)** through **Alternative 5**, including **Preferred Alternative 3**, include sector allocation percentages which would be applied to the revised total ACL from Preferred Alternative 2 in Action 1 (Table 2.2.1.2). The Council considered several alternatives based on the previously used allocation formula, recent fishery performance, and expected needs of the fishery in the near-term future (Table 2.2.1.1). New ACLs would become effective during the 2022/2023 (Table 2.2.1.2) or 2023/2024 fishing year.

Table 2.2.1.1. Current and proposed South Atlantic greater amberjack allocations for Alternatives 1 (No Action)-5.

Action 2 (Allocations)	Recreational Allocation	Commercial Allocation	Rationale
Alternative 1 (No Action)	59.34%	40.66%	Current sector allocations were developed in the Comprehensive ACL Amendment through an equation that used historic catch data, which included recreational catch estimates scaled to MRFSS.
Alternative 2*	70.16%	29.84%	This allocation is based on applying the formula of sector annual catch limit = ((mean landings 2006-2008)*0.5) + ((mean landings 1986-2008)*0.5) to a revised dataset that is inclusive of MRIP FES
Preferred Alternative 3	65.0%	35.0%	This allocation is based on these percentages being approximate midpoints between Alternative 1 and Alternative 2. These percentages are also approximate (rounded to the nearest whole percentage) averages of annual percentages of total landings for each sector from 2010-2019.
Alternative 4	55.00%	45.00%	Additional option considering increase to commercial allocation given growing commercial importance of greater amberjack and ACL reductions to other commercially important snapper grouper species.
Alternative 5	50.00%	50.00%	Additional option considering increase to commercial allocation given growing commercial importance of greater amberjack and ACL reductions to other commercially important snapper grouper species.

*The percentages for Alternative 2 reflect recreational data as per MRIP using the FES method, as well as the most current updates to commercial and for-hire landings.

Table 2.2.1.2. Sector allocations for greater amberjack based on the revised total ACL from Preferred Alternative 2 in Action 1 for the 2023/2024 fishing year. The commercial season is allocated 60% to Season 1 (March-August) and 40% to Season 2 (September-February).

Alternative	Recreational Allocation of the Total ACL	Recreational ACL (lbs ww)	Commercial Allocation of the Total ACL	Commercial ACL* (lbs gw)	Commercial Season 1 Quota (lbs gw)	Commercial Season 2 Quota** (lbs gw)
1 (No action)	59.34%	1,918,462	40.66%	1,263,979	758,387	505,591
2	70.16%	2,268,273	29.84%	927,622	556,573	371,049
3 (Preferred)	65.00%	2,101,450	35.00%	1,088,029	652,817	435,212
4	55.00%	1,778,150	45.00%	1,398,894	839,337	559,558
5	50.00%	1,616,500	50.00%	1,554,327	932,596	621,731

*The total ACL is allocated in pounds whole weight (lbs ww) to the commercial and recreational sectors. The commercial allocation is then converted to pounds gutted weight (lbs gw) for regulatory use in the commercial ACL and seasonal quotas.

**Any remaining quota from commercial Season 1 (March-August) transfers to Season 2 (September-February). Remaining quota from Season 2 is not carried forward.

Vision Blueprint Commercial Regulatory Amendment 27 to the Snapper Grouper FMP (SAFMC 2019) split the commercial fishing year for greater amberjack into two seasons (quotas): 60% of the commercial ACL is allocated to the period of March 1 through August 31 (Season 1) and 40% to the period of September 1 through the end of February (Season 2). Any remaining quota from Season 1 transfers to Season 2, but any remaining quota from Season 2 would not be carried forward. During April each year, no person may sell or purchase a greater amberjack harvested from the South Atlantic exclusive economic zone and the harvest and possession limit is one per person per day or one per person per trip, whichever is more restrictive. Sector ACLs resulting from applying the sector allocation percentages from **Alternative 1 (No Action)** through **Alternative 5** to the total ACL from **Preferred Alternative 2** in Action 1. Based on the recommended OFL, ABC, and revised total ACL, the sector ACLs and commercial seasonal quotas for each alternative proposed under Action 2 are greatest in the 2022-2023 fishing years, and decrease each year until the 2026-2027 fishing year (Tables 2.2.1.3 through 2.2.1.7).

Table 2.2.1.3. Sector ACLs and commercial seasonal quotas for greater amberjack based on the revised total ACL from Preferred Alternative 2 in Action 1 and allocation percentages from Alternative 1 (No Action) in Action 2 (59.34% recreational and 40.66% commercial). The commercial season is allocated 60% to Season 1 (March-August) and 40% to Season 2 (September-February).

Year	Total ACL (lbs ww)	Recreational ACL (lbs ww)	Commercial ACL* (lbs gw)	Commercial Season 1 Quota (lbs gw)	Commercial Season 2 Quota** (lbs gw)
2022/2023	4,380,000	2,599,092	1,712,412	1,027,447	684,965
2023/2024	3,233,000	1,918,462	1,263,979	758,387	505,591
2024/2025	2,818,000	1,672,201	1,101,730	661,038	440,692
2025/2026	2,699,000	1,601,587	1,055,205	633,123	422,082
2026/2027+	2,669,000	1,583,785	1,043,476	626,086	417,391

*The total ACL is allocated in lbs ww to the commercial and recreational sectors. The commercial allocation is then converted to lbs gw for regulatory use in the commercial ACL and seasonal quotas.

**Any remaining quota from commercial Season 1 (March-August) transfers to Season 2 (September-February). Remaining quota from Season 2 is not carried forward.

The allocation percentages in **Alternative 2** are based on applying the formula of sector annual catch limit = ((mean landings 2006-2008)*0.5) + ((mean landings 1986-2008)*0.5) to a revised dataset that includes MRIP FES estimates.

Table 2.2.1.4. Sector ACLs for greater amberjack based on the revised total ACL from Preferred Alternative 2 in Action 1 and allocation percentages from Alternative 2 in Action 2 (70.16% recreational and 29.84% commercial). The commercial season is allocated 60% to Season 1 (March-August) and 40% to Season 2 (September-February).

Year	Total ACL (lbs ww)	Recreational ACL (lbs ww)	Commercial ACL* (lbs gw)	Commercial Season 1 Quota (lbs gw)	Commercial Season 2 Quota** (lbs gw)
2022/2023	4,380,000	3,073,008	1,256,723	754,034	502,689
2023/2024	3,233,000	2,268,273	927,622	556,573	371,049
2024/2025	2,818,000	1,977,109	808,549	485,130	323,420
2025/2026	2,699,000	1,893,618	774,405	464,643	309,762
2026/2027+	2,669,000	1,872,570	765,798	459,479	306,319

*The total annual ACL is allocated in lbs ww to the commercial and recreational sectors. The commercial allocation is then converted to lbs gw for regulatory use in the commercial ACL and seasonal quotas.

**Any remaining quota from commercial Season 1 (March-August) transfers to Season 2 (September-February). Remaining quota from Season 2 is not carried forward.

The allocation percentages in **Preferred Alternative 3** are approximate midpoints between **Alternative 1** and **Alternative 2** in Action 2. These percentages are also approximate (rounded to the nearest whole percentage) averages of annual percentages of total landings for each sector from 2010-2019.

Table 2.2.1.5. Sector ACLs for greater amberjack based on the revised total ACL from Preferred Alternative 2 in Action 1 and allocation percentages from Preferred Alternative 3 in Action 2 (65.00% recreational and 35.00% commercial). The commercial season is allocated 60% to Season 1 (March-August) and 40% to Season 2 (September-February).

Year	Total ACL (lbs ww)	Recreational ACL (lbs ww)	Commercial ACL* (lbs gw)	Commercial Season 1 Quota (lbs gw)	Commercial Season 2 Quota** (lbs gw)
2022/2023	4,380,000	2,847,000	1,474,038	884,423	589,615
2023/2024	3,233,000	2,101,450	1,088,029	652,817	435,212
2024/2025	2,818,000	1,831,700	948,365	569,019	379,346
2025/2026	2,699,000	1,754,350	908,317	544,990	363,327
2026/2027+	2,669,000	1,734,850	898,221	538,933	359,288

*The total ACL is allocated in lbs ww to the commercial and recreational sectors. The commercial allocation is then converted to lbs gw for regulatory use in the commercial ACL and seasonal quotas.

**Any remaining quota from commercial Season 1 (March-August) transfers to Season 2 (September-February). Remaining quota from Season 2 is not carried forward.

Table 2.2.1.6. Sector ACLs for greater amberjack based on the revised total ACL from Preferred Alternative 2 in Action 1 and allocation percentages from Alternative 4 in Action 2 (55.00% recreational and 45.00% commercial). The commercial season is allocated 60% to Season 1 (March-August) and 40% to Season 2 (September-February).

Year	Total ACL (lbs ww)	Recreational ACL (lbs ww)	Commercial ACL* (lbs gw)	Commercial Season 1 Quota (lbs gw)	Commercial Season 2 Quota** (lbs gw)
2022/2023	4,380,000	2,409,000	1,895,192	1,137,115	758,077
2023/2024	3,233,000	1,778,150	1,398,894	839,337	559,558
2024/2025	2,818,000	1,549,900	1,219,327	731,596	487,731
2025/2026	2,699,000	1,484,450	1,167,837	700,702	467,135
2026/2027+	2,669,000	1,467,950	1,154,856	692,913	461,942

* The total ACL is allocated in lbs ww to the commercial and recreational sectors. The commercial allocation is then converted to lbs gw for regulatory use in the commercial ACL and seasonal quotas.

**Any remaining quota from commercial Season 1 (March-August) transfers to Season 2 (September-February). Remaining quota from Season 2 is not carried forward.

Table 2.2.1.7. Sector ACLs for greater amberjack based on the revised total ACL from Preferred Alternative 2 in Action 1 and allocation percentages from Alternative 5 in Action 2 (50.00% recreational and 50.00% commercial). The commercial season is allocated 60% to Season 1 (March-August) and 40% to Season 2 (September-February).

Year	Total ACL (lbs ww)	Recreational ACL (lbs ww)	Commercial ACL* (lbs gw)	Commercial Season 1 Quota (lbs gw)	Commercial Season 2 Quota** (lbs gw)
2022/2023	4,380,000	2,190,000	2,105,769	1,263,462	842,308
2023/2024	3,233,000	1,616,500	1,554,327	932,596	621,731
2024/2025	2,818,000	1,409,000	1,354,808	812,885	541,923
2025/2026	2,699,000	1,349,500	1,297,596	778,558	519,038
2026/2027+	2,669,000	1,334,500	1,283,173	769,904	513,269

*The total ACL is allocated in lbs ww to the commercial and recreational sectors. The commercial allocation is then converted to lbs gw for regulatory use in the commercial ACL and seasonal quotas.

**Any remaining quota from commercial Season 1 (March-August) transfers to Season 2 (September-February). Remaining quota from Season 2 is not carried forward.

2.2.2. Comparison of Alternatives

Biological effects are not expected to be substantially different among **Alternative 1 (No Action)** and **Alternatives 2, 4 and 5**, and **Preferred Alternative 3**, since each sector has aspects of its management (commercial spawning closure, different possession limits, different minimum size limits, etc.) that provide relatively greater biological benefits to the stock. Additionally, Action 2 would not change the total harvest, which is limited to the total ACL specified in Action 1. **Alternative 5** would allocate the highest percentage to the commercial sector (and lowest percentage to the recreational sector), followed by **Alternative 4**, **Alternative 1 (No Action)**, **Preferred Alternative 3** and **Alternative 2**. Therefore, **Alternative 2** allocates the lowest percentage to the commercial sector and the highest to the recreational sector. However,

both the commercial and recreational sectors have effective in-season and post-season AMs in place to prevent their respective ACL from being exceeded and prevent the total ACL from being exceeded, thus preventing overfishing and adverse biological effects. Additionally, since a commercial in-season closure is not expected under almost all of the alternatives proposed under Action 2, and predicted in-season closures for each of the alternatives vary through the season for the recreational sector from 2022/2023 through 2026/2027, the biological effects to the stock would be neutral among each of the alternatives in Action 2.

Sector ACLs that allow for more fish to be landed can result in increased positive economic effects if harvest increases without notable long-term effects on the health of a stock. The sector ACL does not directly impact the fishery for a species unless harvest changes, fishing behavior changes, or the ACL is exceeded, thereby potentially triggering restrictive AMs being triggered that would lead to short-term negative economic effects. Nevertheless, ACLs set above observed harvest levels do create a gap between the ACL and typical landings that may be utilized in years of exceptional abundance or accessibility to a species, thus providing the opportunity for increased landings and a reduced likelihood of triggering restrictive AMs. As such, there are potential economic benefits from ACLs that allow for such a gap. Thus, under this notion, the alternatives in Action 2 can be ranked for the commercial sector from a short-term economic perspective with **Alternative 5** resulting in the highest potential benefits followed by **Alternative 4**, **Alternative 1 (No Action)**, **Preferred Alternative 3**, and **Alternative 2**. For the recreational sector, the ranking would be the opposite with **Alternative 2** resulting in the highest potential benefits followed by **Preferred Alternative 3**, **Alternative 1 (No Action)**, **Alternative 4**, and **Alternative 5**. In terms of total estimated net economic benefits for the action, the same ranking would apply as stated for the recreational sector.

Sector allocations exist for the recreational and commercial sectors already. **Alternative 1 (No Action)** would maintain the current allocation percentages and may have few social effects as both sectors would see an increase in available poundage. With **Alternative 2** and **Preferred Alternative 3**, there would be a decrease in the commercial percentage compared to **Alternative 1 (No Action)**, which could have some negative social effects if commercial fishermen have a negative perception of this change due to the decrease in fishing opportunity and concerns about long-term social effects, especially if future actions further decreased harvest opportunities. However, the increase in poundage may mitigate some of these concerns and result in positive social benefits associated with increased harvest in the short-term.

Under the proposed total ACL in Action 1 (**Preferred Alternative 2**), projections indicate that the commercial ACL for greater amberjack would not be reached under the any of the alternatives proposed in Action 2, apart from a possible closures in Season 1 and Season 2 under the high landings scenario (maximum landings over the last five years and three years, respectively). (Tables 4.2.1.4 and 4.2.1.5). However, the recreational ACL could be reached in fishing year 2026-27 under **Alternative 1 (No Action)**, **Alternative 4**, and **Alternative 5** (Table 4.2.1.7) using the five year average landings. As a result, the recreational sector may experience negative social effects associated with AMs which, when triggered, can restrict harvest in the current season or subsequent seasons (**Section 4.1.3**).

DRAFT DOCUMENT

None of the action alternatives under consideration for greater amberjack allocations would result in substantially different administrative burdens, outside of required public notification of any changes.

2.3. Action 3. Reduce the commercial minimum size limit for greater amberjack

2.3.1. Alternatives

Alternative 1 (No Action). The commercial minimum size limit is 36 inches fork length.

Alternative 2. Reduce the commercial minimum size limit to 34 inches fork length.

Preferred Alternative 3. Reduce the commercial minimum size limit to 32 inches fork length.

Alternative 4. Reduce the commercial minimum size limit to 30 inches fork length.

Alternative 5. Reduce the commercial minimum size limit to 28 inches fork length.

Discussion

The minimum size limits for the commercial and recreational sectors are 36 inches and 28 inches fork length (FL), respectively (Amendment 4 to Snapper Grouper FMP, SAFMC 1991).

Consideration of a reduced commercial minimum size limit was recommended during public scoping (April 2021) and from the Snapper Grouper Advisory Panel (AP) at their April 2021 meeting. The AP recommended consideration of this change to:

- Increase equity between the sectors.
- Reduce time needed to bring fish on board. Larger fish require longer boarding times, which reduce trip efficiency and may serve as an attractant for sharks, potentially leading to depredation.
- Reduce risk of injury to fishermen and fish when trying to bring larger greater amberjack on board. Injuries to the fish can impact release survival, especially for fish just below the minimum size limit.
- Smaller greater amberjack are more commercially desirable.
- The stock assessment indicates that the greater amberjack biomass is above the biomass that would achieve maximum sustainable yield. Thus, the population could possibly sustain harvest of smaller fish.

2.3.2. Comparison of Alternatives

Reducing the current 36-inch FL commercial minimum size limit for greater amberjack under **Alternative 2, Preferred Alternative 3, and Alternatives 4 and 5**, could be expected to increase commercial landings and the probability of landings reaching the ACL, resulting in a closure earlier in the season than under **Alternative 1 (No Action)**. However, discards can be expected to decrease as the minimum size limit decreases as more fish can be kept rather than discarded. Overall, when compared to **Alternative 1 (No Action)**, as harvest rates could be expected to increase under a reduced minimum size limit, the commercial fishing season may be shortened under current AMs if the quota is met in-season. However, because commercial harvest is still constrained by the ACL, and AMs are in place to prevent the ACL from being exceeded, any

increase in harvest should not result in adverse biological consequences to the stock. Therefore, the biological effects to the stock from **Alternative 2, Preferred Alternative 3, and Alternatives 4 and 5** would be neutral relative to **Alternative 1 (No Action)**.

In general, the smaller the minimum size limit, the more that overall harvest is expected to increase, thereby increasing economic benefits incurred from such harvest. Under this notion, the highest economic benefits would occur under **Alternative 5**, followed by **Alternative 4, Preferred Alternative 3, Alternative 2, and Alternative 1 (No Action)**. Data are not available that would provide quantitative analysis of this action (Appendix F).

There is a trade-off with reducing the minimum size limit (**Alternative 2, Preferred Alternative 3, Alternative 4, Alternative 5**) in that an increase in the number of fish that can be kept may improve commercial trip profitability but may also increase the harvest rate and trigger AMs if landings reach the ACL sooner in the fishing year.

None of the action alternatives under consideration for greater amberjack commercial minimum size limits would result in substantially different administrative burdens, outside of required public notification of any changes, and the effects would be neutral under **Alternatives 2 through Alternative 5** compared to **Alternative 1 (No Action)**.

2.4. Action 4. Increase the seasonal commercial trip limits for greater amberjack

2.4.1. Alternatives

Alternative 1 (No Action). The March 1 through August 31 (Season 1) commercial trip limit is 1,200 pounds gutted or whole weight for greater amberjack, and the September 1 through the end of February (Season 2) commercial trip limit is 1,000 pounds gutted or whole weight.

Alternative 2. Modify the March 1 through August 31 (Season 1) commercial trip limit for greater amberjack to be:

Sub-Alternative 2a. 1,500 pounds gutted or whole weight.

Sub-Alternative 2b. 2,000 pounds gutted or whole weight.

Sub-Alternative 2c. 2,500 pounds gutted or whole weight.

Preferred Alternative 3. Modify the September 1 through the end of February (Season 2) commercial trip limit for greater amberjack to be:

Preferred Sub-Alternative 3a. 1,200 pounds gutted or whole weight.

Sub-Alternative 3b. 1,500 pounds gutted or whole weight.

Sub-Alternative 3c. 2,000 pounds gutted or whole weight.

Sub-Alternative 3d. 2,500 pounds gutted or whole weight.

Discussion

The fishing year for greater amberjack is from March 1 through the end of February. The current commercial ACL for greater amberjack is allocated into two quotas: 60% for Season 1 and 40% Season 2. Any remaining quota from Season 1 transfers to Season 2, but any remaining quota from Season 2 does not carry forward. Currently, under **Alternative 1 (No Acton)**, the Season 1 trip limit equals 1,200 lbs ww, and the Season 2 trip limit equals 1,000 lbs ww.¹ **Alternative 2** and its sub-alternatives would modify the Season 1 trip limit, and **Preferred Alternative 3** and its sub-alternatives would modify the Season 2 trip limit. Both **Alternative 2** and **Preferred Alternative 3** (and their sub-alternative) must be selected as preferred alternatives to change the Season 1 and Season 2 trip limit, respectively. Selecting either **Alternative 2** or **Preferred Alternative 3** (and their sub-alternative) as a preferred alternative would only change the trip limit for that season, and the other season would maintain status quo.

¹ Each split season trip limit may currently be harvested and possessed in either lbs ww or gw. The conversion factor between the two measurements is 1.04. Hence, the discrepancy in specifying the proposed trip limit in lbs ww is statistically insignificant and does not change the outcome of any analyses presented in this amendment.

2.4.2. Comparison of Alternatives

The biological effects of **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives would not differ from **Alternative 1 (No Action)** in terms of the risk of overfishing as overall harvest would be limited to the commercial ACL or split-season quotas, and AMs would be triggered if the ACL or quotas were reached. As harvest rates could be expected to increase under an increased trip limit under **Alternative 2** (Season 1) and **Preferred Alternative 3** (Season 2) and their sub-alternatives, the commercial fishing seasons may be shortened under current AMs if the quota is met in-season. However, because commercial harvest is still constrained by the ACL, and AMs are in place to prevent the ACL from being exceeded, any increase in harvest should not result in adverse biological consequences to the stock. Therefore, the biological effects to the stock from **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives could be neutral relative to **Alternative 1 (No Action)**.

Generally, commercial trip limits are not considered to be economically efficient because they require an increase in the number of trips and associated trip costs to land the same amount of fish. However, the negative economic effects of this inefficiency can be offset by price support resulting from the supply limitations and the lengthening of seasons. Higher trip limits could also likely result in the commercial AMs being triggered sooner, thus creating an earlier commercial harvest closure for the species. Conversely, lower trip limits, such as **Alternative 1 (No Action)**, would allow for some level of commercial greater amberjack harvest over a longer period but contribute less to net operating revenue on trips where greater amberjack are landed. Lower trip limits may also restrict the ability of the sector to fully harvest its sector ACL, which in this case would be increasing through Actions 1 and 2 in this amendment. Potential net economic benefits would be highest under **Sub-Alternative 3d**, followed by **Sub-Alternative 3c**, **Sub-Alternative 2c**, **Sub-Alternative 3b**, **Sub-Alternative 2b**, **Preferred Sub-Alternative 3a**, **Sub-Alternative 2a**, and **Alternative 1 (No Action)**.

In general, the potential social effects of a higher trip limit would depend on how fishermen are affected by either a higher trip limit and shorter season, or a lower trip limit and longer seasons. Given most of the projected commercial ACLs are not expected to be met, positive social effects of increased commercial harvest rates under **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives could outweigh potential negative social effects of the commercial ACL being reached and closures occurring earlier in the season.

Alternative 1 (No Action) would not change the administrative environment from its current condition. Under increased trip limits with **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives, the quota may be met faster than under **Alternative 1 (No Action)** and an in-season closure notice would then be required. However, increased administrative effects would be expected to be neutral and not would not be unusually burdensome under **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives compared to **Alternative 1 (No Action)**.

2.5. Action 5. Revise the April spawning closure for greater amberjack

2.5.1. Alternatives

Alternative 1 (No Action). During April each year, no person may sell or purchase a greater amberjack harvested from the South Atlantic exclusive economic zone and the harvest and possession limit is one per person per day or one per person per trip, whichever is more restrictive.

Preferred Alternative 2. Specify during April each year, no person may sell, purchase, harvest, or possess a greater amberjack from the South Atlantic exclusive economic zone and the harvest and possession limits are zero. This closure would apply to both the recreational and commercial sectors.

Alternative 3. Remove the April spawning closure for greater amberjack. Allow purchase, harvest, and possession of greater amberjack from the South Atlantic exclusive economic zone according to regulations specified for the rest of the year.

Discussion

The peak spawning month for greater amberjack is during April and spawning aggregations are very vulnerable to fishing effort during this time of the year (SAFMC 2019a). Due to these concerns of high catch rates of spawning aggregations, Amendment 4 to the Snapper Grouper FMP (SAFMC 1991) implemented a spawning season closure for commercial harvest of greater amberjack in which commercial fishermen were restricted to a 3 fish per person per day limit (the same as the recreational bag limit at the time) during April. That possession limit and sale/purchase restrictions were further modified in Amendment 9 to the Snapper Grouper FMP (SAFMC 1998). Currently, harvest and possession of greater amberjack is limited to one fish per person per day or one per person per trip during April each year, and subject to the prohibition on sale or purchase.

2.5.2. Comparison of Alternatives

Alternative 1 (No Action) offers some protection to spawning fish by currently allowing for a bag limit of only one fish per person per day or per trip which may have positive biological effects on the stock. **Preferred Alternative 2** would also result in additional, and positive, indirect biological effects if greater harvest restrictions are applied during the peak spawning month of April. **Alternative 3** would have direct negative effects on the stock by removing the spawning closure during a peak spawning month for this species. Therefore, while both **Alternative 1 (No Action)** and **Preferred Alternative 2** would offer some protection to the stock, overall, **Preferred Alternative 2** would indirectly provide the greatest biological benefits compared to **Alternative 1 (No Action)** in that it encompasses stricter management measures for both sectors during spawning season. Whereas removing the spawning closure, as proposed under **Alternative 3**, could have negative biological effects relative to **Alternative 1 (No**

Action) and **Preferred Alternative 2** since harvest would be allowed during the peak spawning month.

In general, providing increased protection for spawning greater amberjack would be expected to result in improvements in stock abundance and biomass and create indirect, long-term, positive economic effects presumably through the availability of increased numbers of fish in the future. Removing the April spawning season closure to allow for commercial quantities of greater amberjack to be harvested and sold under **Alternative 3** would be expected to increase commercial landings and net operating revenue, as measured in producer surplus. From a short-term economic benefits perspective, **Alternative 3** would provide the highest economic benefits followed by **Alternative 1 (No Action)** and **Preferred Alternative 2**.

Assuming that closing harvest during spawning ensures sustainable harvest of greater amberjack, as envisioned, long-term benefits to fishing communities in the form of consistent access to the resource would be highest under **Preferred Alternative 2**, followed by **Alternative 1 (No Action)**, and **Alternative 3**. Alternatively, short-term negative effects on fishing communities due to restrictions in fishing opportunities would be lowest under **Alternative 3** followed by **Alternative 1 (No Action)**, and **Preferred Alternative 2**.

Administrative effects would not vary greatly between **Alternative 1 (No Action)** and **Preferred Alternative 2**. Currently, both the commercial and recreational sectors for greater amberjack may only harvest and possess the recreational bag limit during April each year, which is already being monitored for enforcement and compliance. Bag limit regulations under **Alternative 3** would vary between the sectors during the month of April; therefore, beneficial administrative effects would be expected from **Alternative 1 (No Action)** and **Preferred Alternative 2**, when compared with **Alternative 3**. Alternatives that specify consistent regulations in federal waters throughout the Council's jurisdiction would contribute to a more favorable administrative environment by helping the public avoid confusion with regulations and aid law enforcement. Administrative impacts on the agency associated with the action alternatives would be incurred by rulemaking, outreach, education and enforcement.

2.6. Action 6. Remove recreational annual catch targets from the Snapper Grouper Fishery Management Plan

2.6.1. Alternatives

Alternative 1 (No Action). Retain recreational annual catch targets for species managed under the Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region.

Preferred Alternative 2. Remove recreational annual catch targets for species managed under the Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region.

Discussion

Recreational annual catch targets (ACTs) for the species in the Snapper Grouper FMP, were established through the Comprehensive ACL Amendment (2012) to account for uncertainty in recreational catch estimates. They are calculated using the formula: $ACT = ACL * [(1 - PSE) \text{ OR } 0.5, \text{ whichever is greater}]$, where ACL is the recreational annual catch limit and PSE is the average of percent standard errors for recreational harvest estimates from the 5 most recent years of data.

Recreational ACTs are not codified, and are not currently used for management purposes. However, because the recreational ACT is based on the recreational ACL, the recreational ACT values continue to be updated in the FMP when ACLs are changed. **Preferred Alternative 2** would remove the need for recreational ACTs to be evaluated and changed when changes are made to the recreational ACL. Some recreational ACTs are applied to individual species, while others are applied to species complexes. **Preferred Alternative 2** would remove recreational ACTs from both individual species and complexes.

2.6.2. Comparison of Alternatives

The recreational ACTs covered by this action only apply to the recreational sector and are not currently tied to any AMs or other management functions; therefore, there are no expected biological, economic, or social effects associated with their removal (**Preferred Alternative 2**).

Under **Alternative 1 (No Action)**, recreational ACTs must be specified whenever recreational ACLs change. However, because the recreational ACTs for snapper grouper species do not trigger any corrective or preventative action, no additional in-season monitoring is required regardless of where the recreational ACT level is set. Therefore, the administrative burden is expected to be reduced by a small amount under **Preferred Alternative 2**, compared to **Alternative 1 (No Action)**.

Chapter 3. Affected Environment

This section describes the affected environment in the proposed project area. The affected environment is divided into five major components:

- **Habitat Environment** (Section 3.1)
- **Biological and Ecological Environment** (Section 3.2)
- **Economic Environment** (Sections 3.3)
- **Social Environment** (Section 3.4)
- **Administrative Environment** (Section 3.5)

3.1. Habitat Environment

Information on the habitat utilized by species in the snapper grouper fishery management unit (Snapper Grouper FMU) and managed through the Fishery Management Plan (FMP) for the Snapper Grouper Fishery of the South Atlantic Region is included in Volume II of the Fishery Ecosystem Plan (FEP; SAFMC 2009) and the FEP II Dashboard (under revision) which are incorporated here by reference. South Atlantic Fishery Management Council (Council) designated essential fish habitat (EFH) and EFH-Habitat Areas of Particular Concern (EFH-HAPC) are presented in the [SAFMC User Guide](#). Web Services and spatial representations of EFH and other habitat related layers are accessible through the Council's [SAFMC Atlas](#), a platform for searching and visualizing GIS data relevant to the Council's mission and download of GIS layers and information on regional partners is available through the [SAFMC Digital Dashboard](#).

3.1.1. Essential Fish Habitat

EFH is defined in the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) as “those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity” (16 U.S. C. 1802(10)). EFH for species in the Snapper Grouper FMU includes coral reefs, live/hard bottom, submerged aquatic vegetation, artificial reefs and medium to high profile outcroppings on and around the shelf break zone from shore to at least 600 ft (but to at least 2000 ft for wreckfish) where the annual water temperature range is sufficiently warm to maintain adult populations of members of this largely tropical complex. EFH includes the spawning area in the water column above the adult habitat and the additional pelagic environment, including *Sargassum*, required for larval survival and growth up to and

including settlement. In addition, the Gulf Stream is an EFH because it provides a mechanism to disperse snapper grouper larvae.

For specific life stages of estuarine dependent and nearshore snapper grouper species, EFH includes areas inshore of the 100-foot contour, such as attached macroalgae; submerged rooted vascular plants (seagrasses); estuarine emergent vegetated wetlands (saltmarshes, brackish marsh); tidal creeks; estuarine scrub/shrub (mangrove fringe); oyster reefs and shell banks; unconsolidated bottom (soft sediments); artificial reefs; and coral reefs and live/hard bottom.

3.1.2. Habitat Areas of Particular Concern

EFH-HAPC for species in the Snapper Grouper FMU in the Atlantic include medium to high profile offshore hard bottoms where spawning normally occurs; localities of known or likely periodic spawning aggregations; near shore hard bottom areas; The Point, The Ten Fathom Ledge, and Big Rock (North Carolina); The Charleston Bump (South Carolina); mangrove habitat; seagrass habitat; oyster/shell habitat; all coastal inlets; all state-designated nursery habitats of particular importance to snapper grouper (e.g., primary and secondary nursery areas designated in North Carolina); pelagic and benthic *Sargassum*; Hoyt Hills for wreckfish; the Oculina Bank HAPC; all hermatypic coral habitats and reefs; manganese outcroppings on the Blake Plateau; Council-designated artificial reef special management zones; and deep-water marine protected areas. Areas that meet the criteria for EFH-HAPCs include habitats required during each life stage (including egg, larval, post-larval, juvenile, and adult stages).

The Council established the special management zone (SMZ) designation process in 1983 in the Snapper Grouper FMP, and SMZs have been designated in federal waters off North Carolina, South Carolina, Georgia, and Florida since that time. The purpose of the original SMZ designation process, and the subsequent specification of SMZs, was to protect snapper grouper populations at the relatively small, permitted artificial reef sites and “create fishing opportunities that would not otherwise exist.” Thus, the SMZ designation process was centered around protecting the relatively small habitats, which are known to attract desirable snapper grouper species.

Similarly, in the Comprehensive Ecosystem-Based Amendment 1 (CE-BA1; SAFMC 2010), the Council has designated EFH areas and EFH-HAPCs under the Snapper Grouper FMP. Under the Magnuson-Stevens Act, FMPs are required to describe and identify EFH and to minimize the adverse effects of fishing on such habitat to the extent practicable. An EFH-HAPC designation adds an additional layer to the EFH designation. Under the Snapper Grouper FMP, EFH-HAPCs are designated based upon ecological importance, susceptibility to human-induced environmental degradation, susceptibility to stress from development, or rarity of habitat type. The Council determined in CE-BA 1 that the Council-designated SMZs met the criteria to be EFH-HAPCs for species included in the Snapper Grouper FMP. Since CE-BA 1, the Council has designated additional SMZs in the Snapper Grouper FMP. The SMZ and EFH-HAPC designations serve similar purposes in pursuit of identifying and protecting valuable and unique habitat for the benefit of fish populations, which are important to both fish and fishers. Therefore, the Council has determined that a designated SMZ meets the criteria for an EFH-HAPC designation, and the

Council intends that all SMZs designated under the Snapper Grouper FMP are also designated as EFH-HAPCs under the Snapper Grouper FMP.

The potential impacts the actions in this amendment may have on EFH and EFH-HAPCs are discussed in Chapter 4 of this document.

3.2. Biological and Ecological Environment

The waters off the South Atlantic coast are home to a diverse population of fish. The Snapper Grouper FMU contains 55 species of fish, many of them neither “snappers” nor “groupers.” These species live in depths from a few feet (typically as juveniles) to hundreds of feet. As far as north/south distribution, the more temperate species tend to live in the upper reaches of the South Atlantic management area (e.g., black sea bass, red porgy) while the tropical variety’s core residence is in the waters off south Florida, Caribbean Islands, and northern South America (e.g., black grouper, mutton snapper). These are reef-dwelling species that live amongst each other. These species rely on the reef environment for protection and food. There are several reef tracts that follow the southeastern coast. The fact that these fish populations congregate dictates the nature of the fishery (multi-species) and further forms the type of management regulations proposed in this document.

3.2.1. Greater amberjack, *Seriola dumerili*

3.2.1.1. Life History

Greater amberjack, *Seriola dumerili*, is a pelagic species in the Jacks family (Carangidae) (Manooch and Potts 1997a). This species occurs in the Indo-West Pacific, and in the Western and Eastern Atlantic Oceans. In the Western Atlantic, it occurs as far north as Nova Scotia, Canada, southward to Brazil, including the Gulf of Mexico (Carpenter 2002, Manooch and Potts 1997a, Manooch and Potts 1997b). Primary food items include fishes, such as bigeye scad, and invertebrates (Paxton et al. 1989).

Greater amberjack are typically found in 60 to 240 feet of water and juveniles may occur in water less than 30 feet deep ([FWC](#)). However, since it is estimated that South Atlantic greater amberjack have a low release mortality rate of 20% (sensitivity range: 10-30%) (SEDAR 15 2008 and SEDAR 59 2020). Spawning in the South Atlantic region occurs from January through June, with a peak in April and May. Harris et al. (2007) caught fish in spawning condition from North Carolina through the Florida Keys; however, spawning appears to occur primarily off south Florida and the Florida Keys (Harris et al. 2007). Greater amberjack in spawning condition were found in different depths, although the bulk of samples were from the shelf break. Tagging data indicated that greater amberjack are capable of extensive movement that might be related to spawning activity. Greater amberjack tagged off South Carolina have been recaptured off Georgia, east Florida, Florida Keys, west Florida, Cancun Mexico, Cuba, and the Bahamas (MARMAP, unpublished data). This species is the largest jack with a maximum reported size of 190 cm (75 in) and 80.6 kg (177.7 pounds (lbs)) (Paxton et al. 1989). Female greater amberjack are generally larger at age than males (Harris et al. 2007). The maximum reported age is 17 years (Manooch and Potts 1997a). According to Harris et al. (2007), the size at which 50% of

males are mature is 644 mm FL (25 in), whereas all males are mature at 29.5-31 in and age six. Age at 53% maturity for females was 1 year and all females were mature by (31.1 in) and age four SEDAR 59 (2020) (Table 3.2.1.1).

Table 3.2.1.1. Age, fork length, and percent of mature females for South Atlantic greater amberjack. Source: SEDAR 59 (2020).

Age	Fork Length (in)	Female Maturity
1	19.6	53%
2	25.0	89%
3	29.1	99%
4	32.1	100%
5	34.4	100%

3.2.1.2. Stock Status

The Southeast Data, Assessment, and Review (SEDAR) process is a cooperative Fishery Management Council initiative to improve the quality and reliability of fishery stock assessments in the South Atlantic, Gulf of Mexico, and U.S. Caribbean. SEDAR seeks improvements in the scientific quality of stock assessments, constituent and stakeholder participation in assessment development, transparency in the assessment process, and a rigorous and independent scientific review of completed stock assessments.

SEDAR is organized around three public workshops. First is the Data Workshop, during which fisheries monitoring and life history data are reviewed and compiled. Second is the Assessment Workshop, which may be conducted via a workshop and several webinars, during which assessment models are developed and population parameters are estimated using the information provided from the Data Workshop. Third and final is the Review Workshop, during which independent experts review the input data, assessment methods, and assessment products. The completed assessment, including the reports of all three workshops and all supporting documentation, are then forwarded to the Council’s Scientific and Statistical Committee (SSC). The SSC considers whether the assessment represents the best available science and develops fishing level recommendations for Council consideration.

The South Atlantic greater amberjack stock has been assessed in 1999 (Legault and Turner), 2008 (SEDAR 15), and most recently in 2020 (SEDAR 59). Due to limited data, the 1999 assessment (Legault and Turner 1999) evaluated stock status relative to several scenarios of varying maturity schedules, natural mortalities, and biological reference points (or proxies). Most of these scenarios indicated the stock was likely not overfished nor experiencing overfishing. However, this assessment was conducted prior to the approval of reference points for management use, so no formal determination of stock status for greater amberjack could be concluded. A subsequent assessment was conducted through the SEDAR process in 2008 (SEDAR 15 2008). The SEDAR 15 (2008) assessment concluded the stock was not overfished nor experiencing overfishing. The current total ACL and annual OY for greater amberjack are equal to the ABC, which was estimated using the ABC Control Rule, and were implemented in

2012 through the Comprehensive ACL Amendment (Amendment 25 to the Snapper Grouper FMP) (SAFMC 2011d). The current combined commercial and recreational annual catch limit is 1,968,001 lbs whole weight (ww), based on the SSC’s ABC recommendation, which included recreational landings for greater amberjack tracked using Marine Recreational Fishery Statistics Survey (MRFSS) estimation methods.

See Section 1.4 for the most recent stock assessment information for South Atlantic greater amberjack completed in 2020 (SEDAR 59 2020).

3.2.1.3. Landings

Commercial

Commercial landings of South Atlantic greater amberjack have declined since 2015 (Table 3.2.1.2). Landings from 2015 to present have been monitored in lbs gutted weight (gw). Prior to the implementation of the split seasons for greater amberjack from Vision Blueprint Commercial Regulatory Amendment 27 to the Snapper Grouper FMP (SAFMC 2019), there have been recent in-season closures towards the end of the fishing year for the 2015/2016, 2016/2017, 2017/2018 seasons. Therefore, the closure analysis described in Section F.2 used different years of data for different time periods and different sectors because some years had limited landings data due to closures in Season 2.

Table 3.2.1.2. South Atlantic commercial landings (lbs gw) of greater amberjack from March 2014 through February 2020 and percentage of the commercial ACL landed each year. Years with in-season closures due to approaching or exceeding the commercial ACL are indicated with the closure date.

Year	Total Landings (lbs gw)	Commercial ACL (lbs gw)	ACL %	Closure Date
2019-2020	413,643	769,388	53.8	
2018-2019	660,495	769,388	85.8	
2017-2018	1,005,937	769,388	130.7	10/18/17
2016-2017	762,796	769,388	99.1	10/4/16
2015-2016	903,851	769,388	117.5	1/21/16
2014-2015	924,783	769,388	120.2	

Source: SERO Commercial ACL data provided from the SEFSC on September 29, 2021.

*Commercial closure in April for all years.

**2020 landings were considered preliminary.

Recreational

Recreational landings of South Atlantic greater amberjack have declined since 2017 (Table 3.2.1.3). It’s important to note that the recreational landings have changed over the years and this was taken into account when different ACLs were implemented and monitored. Before March of 2018 MRRSS recreational landings were used to compare against the ACL, but in March of 2018 the greater amberjack recreational sector was monitored with MRIP to a new

MRIP based ACL. Landings from 2015 to present have been monitored in lbs whole weight (ww).

Table 3.2.1.3. Recreational landings based on the Marine Recreational Fishery Statistics Survey (MRFSS; lbs ww) of greater amberjack from March 2016 through February 2018, then the recreational landings converted over to MRIP in March of 2018. The recreational landings continued to be MRIP from March of 2018 to 2021. The table also provides the corresponding percentage of recreational ACL landed each year.

Year	Total Landings (lbs ww)	Recreational ACL (lbs ww)	ACL %	Closure Date
2020-2021	615,674	1,167,837	52.7%	
2019-2020	922,221	1,167,837	79.0%	
2018-2019	673,768	1,167,837	57.7%	
2017-2018	1,062,659	1,167,837	91.0%	10/31/2017
2016-2017	1,411,357	1,167,837	120.9%	11/30/2016

Source: SEFSC MRFSS Recreational ACL dataset [January 10, 2022]

3.2.2. Bycatch

The implications of bycatch on the greater amberjack stock and snapper grouper fishery are discussed in Appendix G (Bycatch Practicability Analysis).

3.2.3. Other Species Affected

This amendment indirectly affects other species in the Snapper Grouper FMU (red porgy, vermilion snapper, red snapper, and gray triggerfish) that are caught while fishing for greater amberjack. For summary information on other snapper grouper species that may be affected by the actions in this plan amendment, refer to Section 3.2.5 in [Vision Blueprint Commercial Regulatory Amendment 27 to the Snapper Grouper FMP](#) (SAFMC 2019).

3.2.4. Protected Species

Act (ESA) and the Marine Mammal Protection Act (MMPA). There are 29 ESA-listed species or distinct population segments (DPS) of marine mammals, sea turtles, fish, and corals managed by NMFS that may occur in federal waters of the South Atlantic or Gulf of Mexico. There are 91 stocks of marine mammals managed within the Southeast region plus the addition of the stocks such as North Atlantic right whales (NARW), and humpback, sei, fin, minke, and blue whales that regularly or sometimes occur in Southeast region managed waters for a portion of the year (Hayes et al. 2017). All marine mammals in U.S. waters are protected under the MMPA. The MMPA requires that each commercial fishery be classified by the number of marine mammals they seriously injure or kill. NMFS’s List of Fisheries (LOF)² classifies U.S.

² <https://www.fisheries.noaa.gov/national/marine-mammal-protection/marine-mammal-protection-act-list-fisheries/>

commercial fisheries into three categories based on the number of incidental mortality or serious injury they cause to marine mammals.

Five of the marine mammal species (sperm, sei, fin, blue, and NARW) protected by the MMPA, are also listed as endangered under the ESA. In addition to those five marine mammals, six species or DPSs of sea turtles [green (the North Atlantic DPS and the South Atlantic DPS), hawksbill, Kemp’s ridley, leatherback, and the Northwest Atlantic DPS of loggerhead]; nine species or DPSs of fish (the smalltooth sawfish; five DPSs of Atlantic sturgeon; Nassau grouper; oceanic whitetip shark, and giant manta ray); and seven species of coral (elkhorn coral, staghorn coral, rough cactus coral, pillar coral, lobed star coral, mountainous star coral, and boulder coral) are also protected under the ESA and occur within the action area of the snapper grouper fishery. Portions of designated critical habitat for NARW, the Northwest Atlantic DPS of loggerhead sea turtles, and *Acropora* corals occur within the Council’s jurisdiction.

NMFS completed a formal consultation and resulting biological opinion (Bi-Op) on the conservation regulations under the ESA and the authorization of the South Atlantic snapper grouper fishery in federal waters under the Magnuson-Stevens Act, including the fishery managed by the Snapper Grouper FMP, on threatened and endangered species and designated critical habitat dated December 1, 2016. NMFS concluded that the activities addressed in the consultation are not likely to jeopardize the continued existence of any threatened or endangered species, including the North Atlantic right whale, loggerhead sea turtle Northwest Atlantic DPS, leatherback sea turtle, Kemp’s ridley sea turtle, green sea turtle North Atlantic DPS, green sea turtle South Atlantic DPS, hawksbill sea turtle, smalltooth sawfish U.S. DPS, or Nassau grouper.

Since completing the December 2016 Bi-Op, NMFS published several final rules that listed additional species and designated critical habitat. On January 22, 2018, the giant manta ray (*Manta birostris*) was listed as threatened under the ESA, effective February 21, 2018. On January 30, 2018, the oceanic whitetip shark (*Carcharinus longimanus*) was listed as threatened under the ESA, effective March 1, 2018. Giant manta rays and oceanic whitetip sharks are found in the South Atlantic EEZ and may be affected by the subject fishery via incidental capture in snapper grouper fishing gear. NMFS has reinitiated formal consultation to address these listings and concluded the authorization of the South Atlantic snapper grouper fishery in federal waters during the re-initiation period will not violate ESA Sections 7(a)(2) or 7(d). For summary information on the protected species that may be adversely affected by the snapper grouper fishery and how they are affected refer to Section 3.2.5 in [Vision Blueprint Commercial Regulatory Amendment 27 to the Snapper Grouper FMP](#) (SAFMC 2019).

3.3. Economic Environment

3.3.1. Commercial Sector

Economic information pertaining to the commercial snapper grouper fishery is provided in Regulatory Amendment 29 (SAFMC 2020), Buck (2018), and Overstreet et al. (2018) and is incorporated herein by reference. Select updates to this information specific to greater amberjack are provided below. The major sources of data summarized in this section are the

NMFS Southeast Regional Office (SERO) Permits Information Management System (PIMS) and the SEFSC's Socioeconomic Panel³ data set. Inflation adjusted values are reported in 2020 dollars.

3.3.1.1. Permits

Any fishing vessel that harvests and sells any of the snapper grouper species from the South Atlantic EEZ must have a valid South Atlantic commercial snapper grouper permit, which is a limited access permit. As of August 26, 2021, there were 579 valid or renewable⁴ South Atlantic Snapper Grouper unlimited permits and 112 valid or renewable 225-lb trip-limited permits. Commercial harvest of snapper grouper species in the EEZ may only be sold to dealers with a federal dealer permit. As of August 26, 2021, there were 379 entities with a federal Gulf and South Atlantic Dealers (GSAD) permit.

3.3.1.2. Landings, Value, and Effort

The number of federally permitted commercial vessels that landed South Atlantic greater amberjack experienced a downward trend from 2015 through 2019, decreasing by approximately 22% overall (Table 3.3.1.1). Landings of greater amberjack also decreased by almost half during this time period. On average (2015 through 2019), vessels that landed greater amberjack did so on approximately 20% of their South Atlantic trips and greater amberjack accounted for approximately 7% of their annual all species revenue, including revenue from Gulf of Mexico trips (Table 3.3.1.1 and Table 3.3.1.2). Average all species vessel-level revenue for these vessels fluctuated from 2015 through 2019 (Table 3.3.1.2). During this time period, the average annual price per pound of greater amberjack ranged from \$1.73 to \$1.92 (2020 dollars), with an annual average of \$1.80.

³ This data set is compiled by the SEFSC Social Science Research Group from Federal Logbook System data, supplemented by average prices calculated from the Accumulated Landings System. Because these landings are self-reported, they may diverge slightly from dealer-reported landings presented elsewhere.

⁴ A renewable permit is an expired limited access permit that cannot be actively fished, but can be renewed for up to one year after expiration.

Table 3.3.1.1. Number of vessels, number of trips, and landings in lbs gw by year for South Atlantic greater amberjack.

Year	# of vessels that caught greater amberjack (> 0 lbs gw)	# of trips that caught greater amberjack	greater amberjack landings (lbs gw)	Other species' landings jointly caught w/ greater amberjack (lbs gw)	# of South Atlantic trips that only caught other species	Other species' landings on South Atlantic trips w/o greater amberjack (lbs gw)	All species landings on Gulf trips (lbs gw)
2015	273	2,343	807,617	1,239,111	7,175	3,639,829	379,448
2016	262	1,974	758,309	941,066	7,745	3,775,400	341,113
2017	229	1,764	766,832	842,833	7,609	3,596,325	217,402

Note 1: South Atlantic trips refer to trips taken in Council jurisdictional waters and Gulf trips refer to trips taken in Gulf of Mexico Fishery Management Council jurisdictional waters.

Note 2: Calendar estimates are provided here for all statistics; however, because the greater amberjack fishing year does not align with the calendar year (it runs from March through February), these will differ from greater amberjack fishing year landings estimates. Additionally, landings from state waters by vessels without federal permits are not included.

Estimates of net revenue specific to the vessels affected by this amendment are not readily available; however, it is assumed there is an overlap between these vessels and vessels that participate in the commercial South Atlantic Jacks fishery in general. C. Liese (NMFS SEFSC, pers. comm. 2022) generated annual vessel-level estimates of costs (as a percentage of revenue) and net revenue from operations for vessels that harvested Jacks species in the South Atlantic. Estimates of producer surplus (PS) can be calculated from the cost information. PS is total annual revenue minus the costs for fuel, other supplies, hired crew, and the opportunity cost of an owner's time as captain. Net revenue from operations, which most closely represents economic profits to the owner(s), is total annual revenue minus the costs for fuel, other supplies, hired crew, vessel repair and maintenance, insurance, overhead, and the opportunity cost of an owner's time as captain, as well as the vessel's depreciation. According to C. Liese (NMFS SEFSC, pers. comm. 2022), PS for commercial vessels that harvested South Atlantic Jacks species was approximately 35% of their annual gross revenue, on average, from 2014 through 2018. Net revenue from operations was 4% of their annual gross revenue, on average, during this period. Applying these percentages to the results provided in Table 3.3.1.2 would result in an estimated per vessel average annual PS of \$23,957 (2021 dollars) and an average annual net revenue from operations of \$2,738 per year.

C. Liese (NMFS SEFSC, pers. comm. 2022) also generated annual trip-level estimates of net revenue, which can be interpreted as a measure of PS at the trip-level for trips that harvested Jacks. According to C. Liese (NMFS SEFSC, pers. comm. 2022), trip-level PS for commercial trips that harvested South Atlantic Jacks species was approximately 28% of gross trip revenue, on average, from 2014 through 2018.

Dealers

The information in Table 3.3.1.3 illustrates the purchasing activities of dealers that bought South Atlantic greater amberjack landings from vessels during 2015 through 2019.⁵ Like vessels, dealer participation in particular fisheries is fluid, and not all dealers purchased greater amberjack in each year during this time. On average, from 2015 through 2019, greater amberjack purchases comprised approximately 1% of all purchases made by these dealers. The average annual value of total purchases per greater amberjack dealer was fairly stable from 2015 through 2019, with a 5-year low in 2018 (Table 3.3.1.3). Although not shown in the table, the maximum annual value of all purchases made by a single greater amberjack dealer from 2015 through 2019 was \$10.8 million (2020 dollars) in 2019.

⁵ The estimates in this table are based on Accumulated Landings System data, which tends to produce slightly different estimates of ex-vessel landings and value for greater amberjack than the SEFSC-SSRG socio-economic panel database.

Table 3.3.1.3. Purchase statistics for dealers that bought South Atlantic greater amberjack landings (2020 dollars).

Year	Number of Dealers	Greater Amberjack landed lbs gw	Greater Amberjack Purchases	Other South Atlantic Purchases	Gulf Purchases	Average purchases value per dealer
2015	101	792,660	\$ 1,384,991	\$ 94,062,213	\$ 14,438,358	\$ 1,087,976
2016	97	772,650	\$ 1,397,442	\$101,112,617	\$ 13,839,384	\$ 1,199,479
2017	89	807,265	\$ 1,397,578	\$ 89,410,857	\$ 11,702,633	\$ 1,151,810

3.3.1.3. Imports

Imports of seafood products compete in the domestic seafood market and have in fact dominated many segments of the seafood market. Imports affect the price for domestic seafood products and tend to set the price in the market segments in which they dominate. Seafood imports have downstream effects on the local fish market. At the harvest level for snapper and grouper species (inclusive of other species that are part of the Snapper Grouper FMP such as greater amberjack), imports affect the returns to fishermen through the ex-vessel prices they receive for their landings. As substitutes to the domestic production of snapper and grouper species, imports tend to cushion the adverse economic effects on consumers resulting from a reduction in domestic landings. The following describes the imports of fish products that directly compete with the domestic harvest of snapper and grouper species. Import data for greater amberjack, in particular, are not available.

Imports⁶ of fresh snapper increased from 26.1 million lbs product weight (pw) in 2015 to 32.8 million lbs pw in 2019. During this time, total revenue from fresh snapper imports ranged from approximately \$85.7 million (2020 dollars⁷) to \$110.8 million. Imports of fresh snappers primarily originated in Mexico or Central America and entered the U.S. through the port of Miami, Florida. Imports of fresh snapper were highest on average (2015 through 2019) during the months of March through July. Imports of frozen snapper increased from 12.3 million lbs pw in 2015 to 14.4 million lbs pw in 2016, then decreased steadily to 11.4 million lbs pw in 2019. The annual value of these imports ranged from approximately \$35.2 million (2020 dollars) to \$40.8 million, with a peak in 2016. Imports of frozen snapper primarily originated in South America (especially Brazil), Indonesia, Mexico, and Central America. The majority of frozen snapper imports entered the U.S. through the ports of Miami, Florida, New York, New York, and

⁶ NOAA Fisheries Service purchases fisheries trade data from the Foreign Trade Division of the U.S. Census Bureau. Data are available for download at <https://www.fisheries.noaa.gov/national/sustainable-fisheries/foreign-fishery-trade-data>

⁷ Converted to 2020 dollars using the annual, not seasonally adjusted GDP implicit price deflator provided by the U.S. Bureau of Economic Analysis.

San Juan, Puerto Rico. Imports of frozen snappers tended to be lowest during March through May when fresh snapper imports were high.

Imports of fresh grouper ranged from 10.7 million lbs pw to 12.5 million lbs pw from 2015 through 2019. During this time, total revenue from fresh grouper imports ranged from approximately \$48.2 million (2020 dollars) to \$55.2 million. Imports of fresh grouper primarily originated in Mexico, Central America, or South America and entered the U.S. through the ports of Miami, Florida and Tampa, Florida. On average (2015 through 2019), monthly imports of fresh grouper were mostly stable with a peak in July. Imports of frozen grouper ranged from 0.8 million lbs pw to 4.6 million lbs pw during 2015 through 2019. The annual value of these imports ranged from approximately \$1.6 million (2020 dollars) to \$5.9 million, with a peak in 2018. Imports of frozen grouper primarily originated in Mexico and India. The majority of frozen grouper imports entered the U.S. through the ports of Miami, Florida, Tampa, Florida, and New York, New York. On average (2015 through 2019), monthly imports of frozen groupers were greatest during the months of January through March and July.

3.3.1.4. Business Activity

The commercial harvest and subsequent sales and consumption of fish generates business activity as fishermen expend funds to harvest the fish and consumers spend money on goods and services, such as seafood purchased at a local fish market and served during restaurant visits. These expenditures spur additional business activity in the region(s) where the harvest and purchases are made, such as jobs in local fish markets, grocers, restaurants, and fishing supply establishments. In the absence of the availability of a given species for purchase, consumers would spend their money on substitute goods, such as other finfish or seafood products, and services, such as visits to different food service establishments. As a result, the analysis presented below represents a distributional analysis only; that is, it only shows how economic effects may be distributed through regional markets and should not be interpreted to represent the impacts if these species are not available for harvest or purchase.

Estimates of the U.S. average annual business activity associated with the commercial harvest of greater amberjack in the South Atlantic were derived using the model developed for and applied in NMFS (2021) and are provided in Table 3.3.1.4.⁸ This business activity is characterized as jobs (full- and part-time), income impacts (wages, salaries, and self-employed income), output impacts (gross business sales), and value-added impacts, which represent the contribution made to the U.S. Gross Domestic Product (GDP). These impacts should not be added together because this would result in double counting. These results are based on average relationships developed through the analysis of many fishing operations that harvest many different species. Separate models to address individual species are not available. For example, the results provided here apply to a general “all other finfish” category, rather than just greater amberjack, and a harvester job is “generated” for approximately every \$35,700 (2020 dollars) in ex-vessel revenue. These results contrast with the number of harvesters (vessels) with recorded landings of greater amberjack presented in Table 3.3.1.1.

⁸ A detailed description of the input/output model is provided in NMFS (2011).

Table 3.3.1.4. Average annual business activity (2015 through 2019) associated with the commercial harvest of greater amberjack in the South Atlantic. All monetary estimates are in 2020 dollars.*

Species	Average Ex-vessel Value (\$ thousands)	Total Jobs	Harvester Jobs	Output (Sales) Impacts (\$ thousands)	Income Impacts (\$ thousands)	Value Added (\$ thousands)
Greater Amberjack	\$1,193	147	33	\$11,867	\$4,300	\$6,107

Source: Calculated by NMFS SERO using the model developed for and applied in NMFS (2021).

*Converted to 2020 dollars using the annual, not seasonally adjusted GDP implicit price deflator provided by the U.S. Bureau of Economic Analysis.

3.3.2. Recreational Sector

The recreational sector is comprised of the private and for-hire modes. The private mode includes anglers fishing from shore (all land-based structures) and private/rental boats. The for-hire mode is composed of charter vessels and headboats. Charter vessels generally carry fewer passengers and charge a fee on an entire vessel basis, whereas headboats carry more passengers and payment is per person. The type of service, from a vessel- or passenger-size perspective, affects the flexibility to search different fishing locations during the course of a trip and target different species because larger concentrations of fish are required to satisfy larger groups of anglers.

3.3.2.1. Permits

For-hire vessels are required to have a for-hire snapper grouper permit to fish for or possess snapper grouper species in the South Atlantic EEZ. As of August 26, 2021, there were 1,930 valid for-hire snapper grouper permits. This sector operates as an open access fishery and not all permitted vessels are necessarily active in the fishery. Some vessel owners may have obtained open access permits as insurance for uncertainties in the fisheries in which they currently operate.

Although the for-hire permit application collects information on the primary method of operation, the permit itself does not identify the permitted vessel as either a headboat or a charter vessel and vessels may operate in both capacities. However, only federally permitted headboats are required to submit harvest and effort information to the NMFS Southeast Region Headboat Survey (SRHS).⁹ Participation in the SRHS is based on a determination by the SEFSC that the vessel primarily operates as a headboat. As of March 9, 2021, 64 Gulf headboats were registered

⁹ All federal charter/headboat permit holders, including charter vessel owners or operators, are required to comply with the new Southeast For-Hire Electronic Reporting Program as of January 2021. Under this program, all such permit holders must submit logbooks weekly, by 11:59 pm, local time, the Tuesday following a reporting week (Monday-Sunday). Those vessels selected to report to the SRHS (i.e., federally permitted headboats) will continue to submit their reports under the new requirements directly to the SRHS program. For more information, see: https://www.fisheries.noaa.gov/southeast/recreational-fishing-data/southeast-hire-electronic-reporting-program?utm_medium=email&utm_source=govdelivery

in the SRHS (K. Fitzpatrick, NMFS SEFSC, pers. comm. 2021). The majority of these headboats were located in Florida/Georgia (39), followed by North Carolina (14) and South Carolina (11).

There are no specific Federal permitting requirements for recreational anglers to harvest snapper grouper species. Instead, anglers are required to possess either a state recreational fishing permit that authorizes saltwater fishing in general or be registered in the federal National Saltwater Angler Registry system, subject to appropriate exemptions. As a result, it is not possible to identify with available data how many individual anglers would be expected to be affected by this proposed amendment.

3.3.2.2. Angler Effort

Recreational effort derived from the Marine Recreational Information Program (MRIP) database can be characterized in terms of the number of trips as follows:

- Target effort - The number of individual angler trips, regardless of duration, where the intercepted angler indicated that the species or a species in the species group was targeted as either the first or the second primary target for the trip. The species did not have to be caught.
- Catch effort - The number of individual angler trips, regardless of duration and target intent, where the individual species or a species in the species group was caught. The fish did not have to be kept.
- Total recreational trips - The total estimated number of recreational trips in the South Atlantic, regardless of target intent or catch success.

Estimates of greater amberjack target and catch effort are provided in Table 3.3.2.1 and Table 3.3.2.2, respectively. It is important to note that in 2018, MRIP transitioned from the Coastal Household Telephone Survey (CHTS) to the mail-based fishing effort survey (FES). The estimates presented in Table 3.3.2.1 and Table 3.3.2.2 are calibrated to the MRIP FES and may be greater than estimates that are non-calibrated.¹⁰ The majority of greater amberjack target and catch trips in the South Atlantic, as estimated by MRIP, were recorded in Florida and the private/rental mode was the predominant mode of fishing on these trips (Table 3.3.2.1 and Table 3.3.2.2). The overall number of target trips for greater amberjack steadily increased in the South Atlantic from 2015 through 2017 but then decreased through 2019 (Table 3.3.2.1). South Atlantic greater amberjack catch trips fluctuated during this time period with a peak in 2016 (Table 3.3.2.2).

¹⁰ As of August 2018, all directed trip estimate information provided by MRIP (public use survey data and directed trip query results) for the entire time series were updated to account for both the Access Point Angler Intercept Survey (APAIS) design change in 2013, as well as the transition from the CHTS to the FES in 2018. Back-calibrated estimates of directed effort are not available. For more information, see: <https://www.fisheries.noaa.gov/recreational-fishing-data/recreational-fishing-estimate-updates>.

Note 3: Includes post-stratified effort estimates from Monroe County, FL to align with SEDAR estimates.

On average, from 2015 through 2019, South Atlantic target trips for greater amberjack were concentrated most heavily in MRIP waves 3 and 4 (May-August; Figure 3.3.2.1). Almost all of the charter effort, in particular, occurred within these waves, which is notably outside of the April spawning closure for greater amberjack.

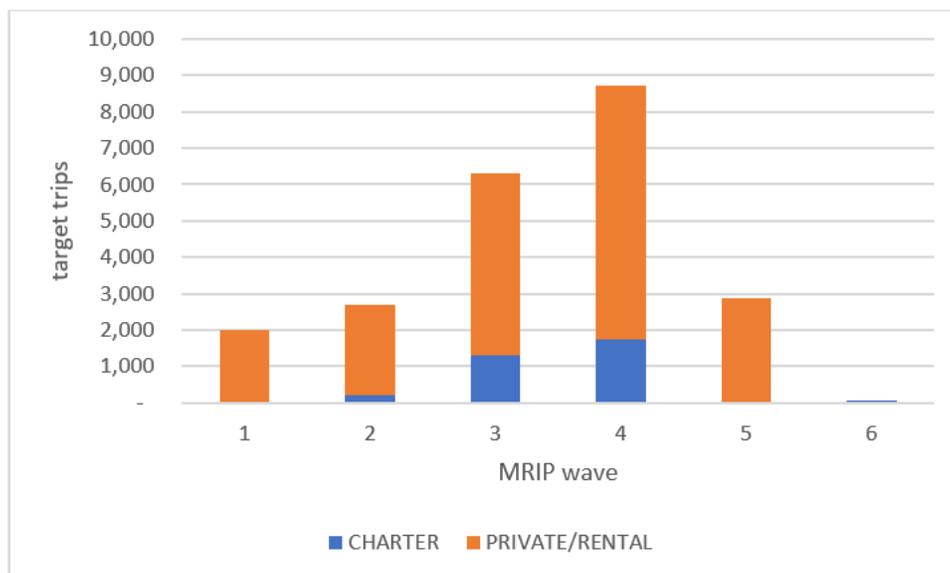

Figure 3.3.2.1 South Atlantic greater amberjack recreational target trips, by mode and wave (average of 2015 – 2019).

Source: MRIP database, SERO, NMFS (October, 2021).

Note: There were no shore mode target trips recorded during the time period.

Similar analysis of recreational angler trips is not possible for the headboat mode because headboat data are not collected at the angler level. Estimates of effort by the headboat mode are provided in terms of angler days, or the total number of standardized full-day angler trips.¹¹ From 2015 through 2019, headboat effort in the South Atlantic, in terms of angler days, decreased substantially in Florida through Georgia (39% decline) and in North Carolina (32% decline). In South Carolina, there were modest fluctuations in headboat effort during this time period (Table 3.3.2.3). Headboat effort was the highest, on average, during the summer months of June through August (Table 3.3.2.4).

¹¹ Headboat trip categories include half-, three-quarter-, full-, and 2-day trips. A full-day trip equals one angler day, a half-day trip equals .5 angler days, etc. Angler days are not standardized to an hourly measure of effort and actual trip durations may vary within each category.

Table 3.3.2.3. South Atlantic headboat angler days and percent distribution by state (2015 through 2019).

3.3.2.3. Economic Value

Participation, effort, and harvest are indicators of the value of saltwater recreational fishing. However, a more specific indicator of value is the satisfaction that anglers experience over and above their costs of fishing. The monetary value of this satisfaction is referred to as consumer surplus (CS). The value or benefit derived from the recreational experience is dependent on several quality determinants, which include fish size, catch success rate, and the number of fish kept. These variables help determine the value of a fishing trip and influence total demand for recreational fishing trips.

Direct estimates of the CS for greater amberjack are not currently available. There are, however, estimates for snapper and grouper species in general. Haab et al. (2012) estimated the CS (willingness to pay [WTP] for one additional fish caught and kept) for snappers and groupers in the Southeastern U.S. using four separate econometric modeling techniques. The finite mixture model, which takes into account variation in the preferences of fishermen, had the best prediction rates of the four models and, therefore, was selected for presentation here. The WTP for an additional snapper (excluding red snapper) estimated by this model was \$13.11 (2020 dollars).¹² Although this estimate is not specific to greater amberjack, the study did include the amberjack genus as part of the snapper group. This value may seem low and may be strongly influenced by the pooling effect inherent to the model in which it was estimated. The WTP for an additional red snapper, in comparison, was estimated to be \$148.57 (2020 dollars). The WTP for an additional grouper was estimated to be \$142.74 (2020 dollars).

The foregoing estimates of economic value should not be confused with economic impacts associated with recreational fishing expenditures. Although expenditures for a specific good or service may represent a proxy or lower bound of value (a person would not logically pay more for something than it was worth to them), they do not represent the net value (benefits minus cost), nor the change in value associated with a change in the fishing experience.

With regard to for-hire businesses, economic value can be measured by producer surplus (PS) per passenger trip (the amount of money that a vessel owner earns in excess of the cost of providing the trip). Estimates of the PS per for-hire passenger trip are not available. Instead, trip net revenue (TNR), which is the return used to pay all labor wages, returns to capital, and owner profits, is used as a proxy for PS. When TNR is divided by the number of anglers on a trip, it represents cash flow per angler (CFpA). The estimated CFpA value for an average South Atlantic charter angler trip is \$203 (2020 dollars) and the estimated CFpA value for an average South Atlantic headboat angler trip is \$71 (Souza and Liese 2019). Estimates of CFpA for a greater amberjack target trip, in particular, are not available.

According to Holland et al. (2012), the average charter vessel operating in the South Atlantic is estimated to receive approximately \$127,000 (2020 dollars) in gross revenue annually. The average headboat is estimated to receive approximately \$224,000 (2020 dollars) in gross revenue annually. However, a more recent estimate of average annual gross revenue for South Atlantic headboats is available from D. Carter (pers. comm., March 15, 2018). Carter (pers. comm.,

¹² Converted to 2020 dollars using the annual, not seasonally adjusted GDP implicit price deflator provided by the U.S. Bureau of Economic Analysis (BEA).

March 15, 2018) recently estimated that average annual gross revenue for South Atlantic headboats was approximately \$307,770 (2020 dollars) in 2017. This estimate is likely the best current estimate of annual gross revenue for South Atlantic headboats, as it is based on a relatively large sample and is more recent. The difference in the Holland et al. (2012) and Carter (pers. comm., March 15, 2018) estimates for headboats suggests that the estimate for charter vessels based on Holland et al. (2012) is likely an underestimate of current average annual revenue for charter vessels in the South Atlantic. Comparable estimates of annual net income for South Atlantic charter vessels and headboats are not available.

3.3.2.4. Business Activity

The desire for recreational fishing generates economic activity as consumers spend their income on various goods and services needed for recreational fishing. This income spurs economic activity in the region where recreational fishing occurs. It should be clearly noted that, in the absence of the opportunity to fish, the income would presumably be spent on other goods and services and these expenditures would similarly generate economic activity in the region where the expenditure occurs. As such, the analysis below represents a distributional analysis only.

Estimates of the business activity (economic impacts) associated with recreational angling for South Atlantic greater amberjack were calculated using average trip-level impact coefficients derived from the 2017 Fisheries Economics of the U.S. report (NMFS 2021b) and underlying data provided by the National Oceanic and Atmospheric Administration (NOAA) Office of Science and Technology. Economic impact estimates in 2017 dollars were adjusted to 2020 dollars using the annual, not seasonally adjusted GDP implicit price deflator provided by the U.S. Bureau of Economic Analysis.

Business activity (economic impacts) for the recreational sector is characterized in the form of jobs (full- and part-time), income impacts (wages, salaries, and self-employed income), output impacts (gross business sales), and value-added impacts (contribution to the GDP in a state or region). Estimates of the average annual economic impacts (2015-2019) resulting from South Atlantic recreational greater amberjack target trips are provided in Table 3.3.2.5. The average impact coefficients, or multipliers, used in the model are invariant to the “type” of effort (e.g., target or catch) and can therefore be directly used to measure the impact of other effort measures such as greater amberjack catch trips. To calculate the multipliers from Table 3.3.2.5, simply divide the desired impact measure (sales impact, value-added impact, income impact or employment) associated with a given state and mode by the number of target trips for that state and mode.

The estimates provided in Table 3.3.2.5 only apply at the state-level. Addition of the state-level estimates to produce a regional (or national) total may underestimate the actual amount of total business activity, because state-level impact multipliers do not account for interstate and interregional trading. It is also important to note, that these economic impacts estimates are based on trip expenditures only and do not account for durable expenditures. Durable expenditures cannot be reasonably apportioned to individual species or species groups. As such, the estimates provided in Table 3.3.2.5 may be considered a lower bound on the economic activity associated with those trips that targeted greater amberjack.

Estimates of the business activity associated with headboat effort are not available. Headboat vessels are not covered in MRIP, so, in addition to the absence of estimates of target effort, estimation of the appropriate business activity coefficients for headboat effort has not been conducted.

Table 3.3.2.5. Estimated annual average economic impacts (2015-2019) from South Atlantic recreational greater amberjack target trips, by state and mode, using state-level multipliers. All monetary estimates are in 2020 dollars (in thousands).

3.4. Social Environment

This section provides the background for the proposed actions, which are evaluated in Chapter 4. Commercial and recreational landings and permits by state are included to provide information on the geographic distribution of fishing involvement. Descriptions of the top-ranking communities by the number of commercial snapper grouper permits are included, top

communities based on commercial landings of greater amberjack, commercial engagement and reliance for the top communities based on commercial landings of greater amberjack, local quotient for the top three communities based on commercial greater amberjack landings, top-ranking communities by the number of for-hire snapper grouper permits, and top communities based on recreational engagement and reliance. Community level data are presented in order to meet the requirements of National Standard 8 of the Magnuson-Stevens Act, which requires the consideration of the importance of fishery resources to human communities when changes to fishing regulations are considered. Lastly, social vulnerability data are presented to assess the potential for environmental justice concerns. Additional detailed information about communities in the following analysis can be found on the SERO's Community Snapshots website.¹³

3.4.1. Commercial Sector

3.4.1.1. Landings by State

The greatest proportion of commercial greater amberjack landings came from waters adjacent to Florida and Georgia (average of 80.9% from 2015-2019, SEFSC Commercial ACL File), followed by North Carolina (10.4%), and South Carolina (8.8%). The landings for Florida and Georgia are combined to protect confidentiality.

3.4.1.2. Permits

The majority of snapper grouper unlimited permits are issued to individuals in Florida (67.2%), followed by North Carolina (19.3%), South Carolina (7.9%), and Georgia (1.5%, SERO Permits Office, April 8, 2021). Residents of other states (Illinois Louisiana, Michigan, Minnesota, New Jersey, New York, Ohio, Texas, and West Virginia) also hold snapper grouper unlimited permits, but these states represent a small percentage of the issued permits.

South Atlantic snapper grouper unlimited permits are held by individuals with mailing addresses in 152 communities (SERO Permits Office, April 8, 2021). Communities with the most snapper grouper unlimited permits are located in Florida, South Carolina, North Carolina, and Texas (Table 3.4.1.1). The communities with the most snapper grouper unlimited permits are Key West (9.8% of snapper grouper unlimited permits), Jacksonville (7.9%), and Miami, Florida (3.7%).

Source: SERO Permits Office, April 8, 2021.

The majority of snapper grouper 225-lb trip-limited permits are issued to individuals in Florida (85.6%), followed by North Carolina (9.3%, SERO Permits Office, April 8, 2021). Residents of other states (New Jersey, South Carolina, Texas, and Virginia) also hold snapper grouper 225-lb trip-limited permits, but these states represent a small percentage of the issued permits.

South Atlantic commercial snapper grouper 225-lb trip-limited permits are held by individuals with mailing addresses in 51 communities (SERO Permits Office, April 8, 2021). Communities with the most commercial snapper grouper 225-lb trip-limited permits are located in Florida and North Carolina (Table 3.4.1.1). The communities with the most snapper grouper 225-lb trip-limited permits are Key West (9.3% of snapper grouper 225-lb trip-limited permits), Marathon (8.2%), and Jupiter, Florida (6.2%).

3.4.1.3. Regional Quotient

The descriptions of communities include information about the top communities based on a “regional quotient” (RQ) of commercial landings for greater amberjack. The RQ is the proportion of landings out of the total landings of that species for that region and that year, and is a relative measure. Figure 3.4.1.1 includes the communities with the strongest relationship to the commercial sector of the greater amberjack fishery by RQ landings and value during 2019. The top greater amberjack communities are located in Florida, South Carolina, and North Carolina.

About 17% of greater amberjack is landed in the top community of Port Orange, Florida, representing about 22% of the South Atlantic ex-vessel value for the species.

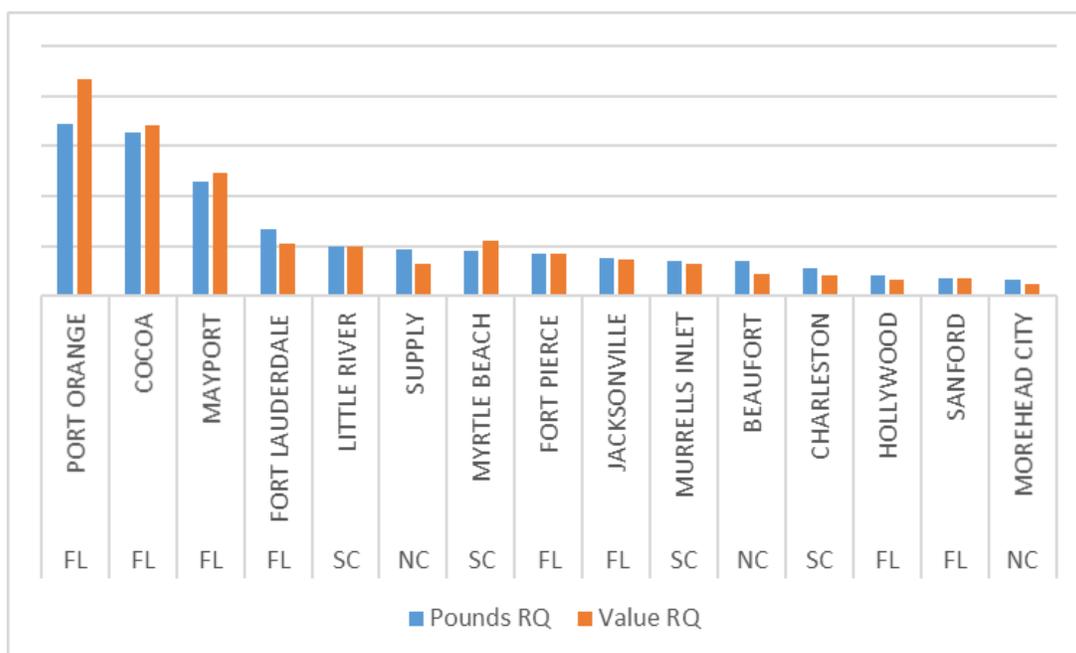

Figure 3.4.1.1. Top South Atlantic communities ranked by lbs and value RQ of greater amberjack. The actual RQ values (y-axis) are omitted from the figure to maintain confidentiality.

Source: SERO, Community ALS 2019.

3.4.1.4. Local Quotient

The top three communities of Port Orange, Florida; Cocoa, Florida; and Mayport, Florida include the greatest proportion of greater amberjack landings (Figure 3.4.1.1) and have been selected to receive more in-depth descriptions of their fishing involvement. The description of these communities include information about the top species landed in the community based on the “local quotient” (LQ) of commercial landings. The LQ is the proportion of landings for each species out of the total landings for all species for that community and that year, and is a relative measure.

Port Orange

The top species by pounds landed in Port Orange, Florida are striped mullet, king mackerel, golden tilefish, wreckfish, and northern white shrimp (Figure 3.4.1.2). However, the top species by value in Port Orange in ranked order are golden tilefish, wreckfish, northern white shrimp, king mackerel, and southern flounder. Greater amberjack ranks sixth by LQ value and seventh by LQ pounds for Port Orange.

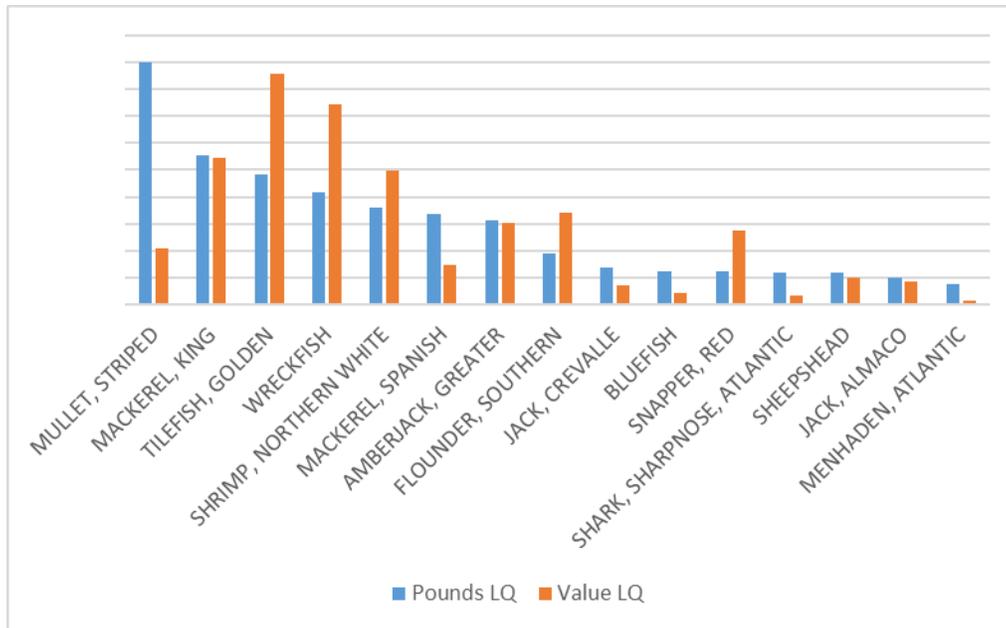

Figure 3.4.1.2. Top fifteen species landed in Port Orange, Florida ranked by lbs and value LQ. The actual LQ values (y-axis) are omitted from the figure to maintain confidentiality. Source: SERO, Community ALS 2019.

Cocoa

The top species landed in Cocoa, Florida are king mackerel and Spanish mackerel, which make up the majority of landings in the community (Figure 3.4.1.3). Greater amberjack ranks eleventh by LQ pounds and seventh by LQ value for Cocoa.

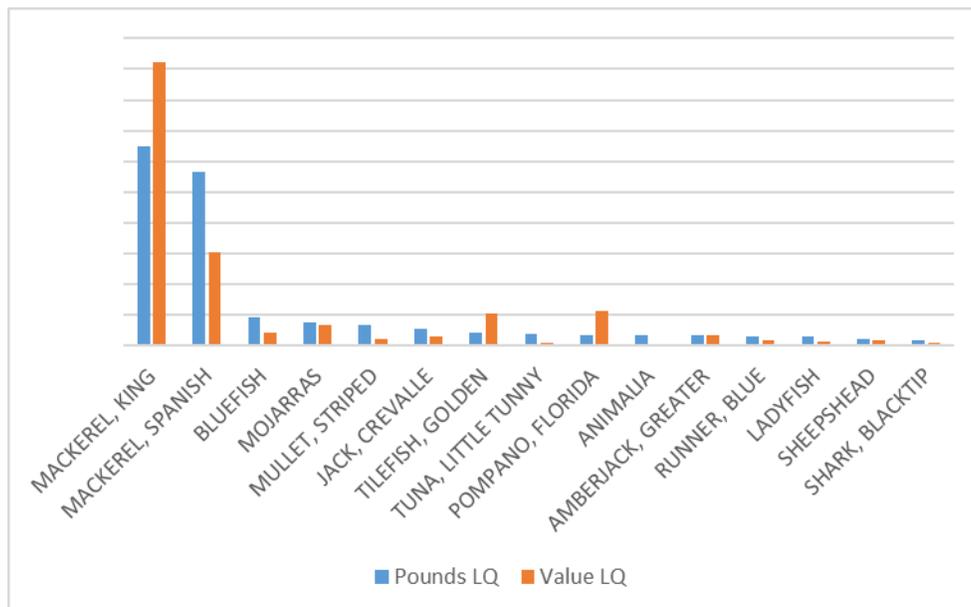

Figure 3.4.1.3. Top fifteen species landed in Cocoa, Florida ranked by lbs and value LQ. The actual LQ values (y-axis) are omitted from the figure to maintain confidentiality. Source: SERO, Community ALS 2019.

Mayport

The top species landed in Mayport, Florida is northern white shrimp, which makes up the majority of landings in the community (Figure 3.4.1.4). Greater amberjack ranks eighth by LQ pounds and tenth by LQ value for Mayport.

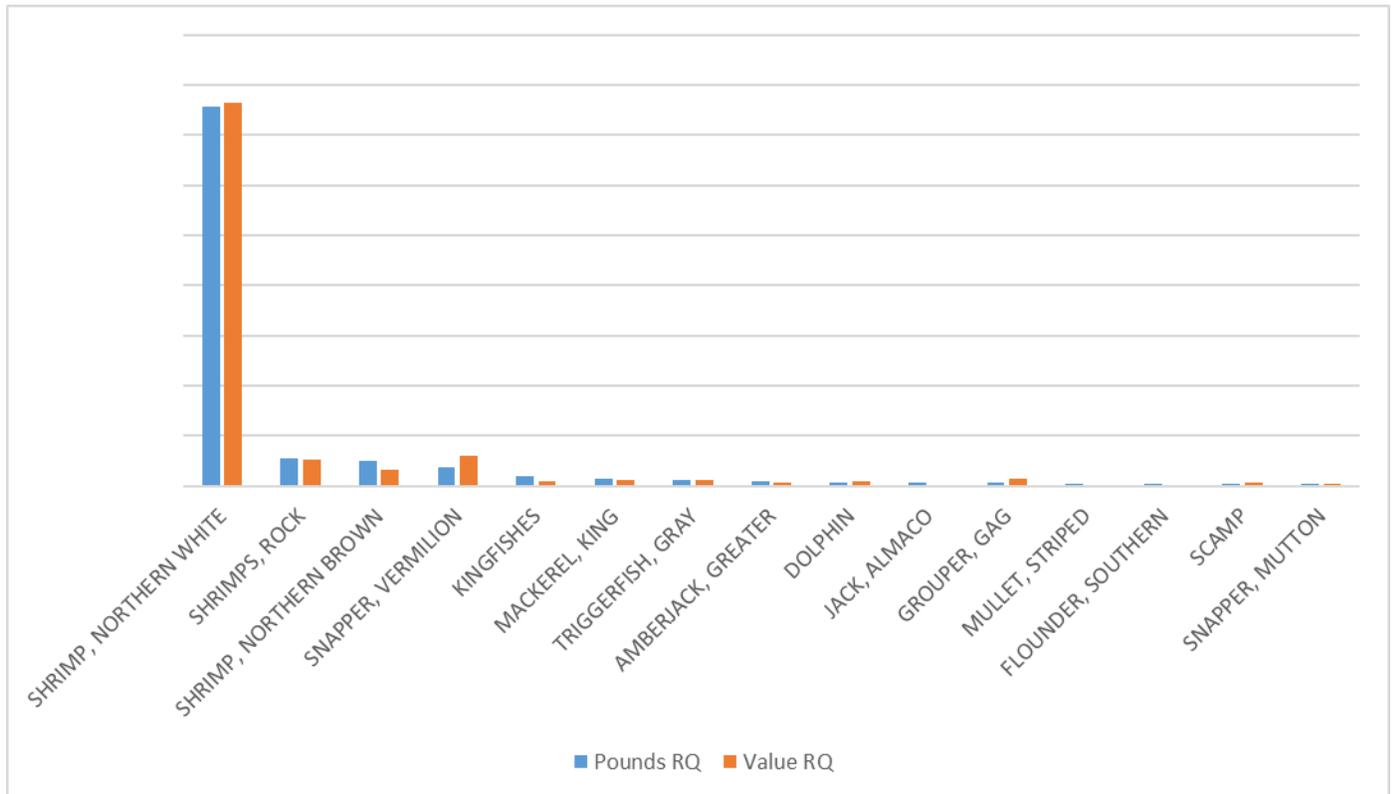

Figure 3.4.1.4. Top fifteen species landed in Mayport, Florida ranked by lbs and value LQ. The actual LQ values (y-axis) are omitted from the figure to maintain confidentiality. Source: SERO, Community ALS 2019.

3.4.1.5. Engagement and Reliance

Figure 3.4.1.5 is an overall measure of a community’s commercial fishing engagement and reliance and includes the communities with the strongest relationship to the commercial sector for greater amberjack as depicted in Figure 3.4.1.1. Most communities in Figure 3.4.1.5 would be considered to be highly or moderately engaged in commercial fishing, as several are at or above 1 standard deviation of the mean factor score and most are at or above ½ standard deviation. Myrtle Beach, South Carolina and Hollywood, Florida show the least amount of engagement in commercial fishing overall. Only Beaufort, North Carolina demonstrates a moderate to high level of commercial reliance.

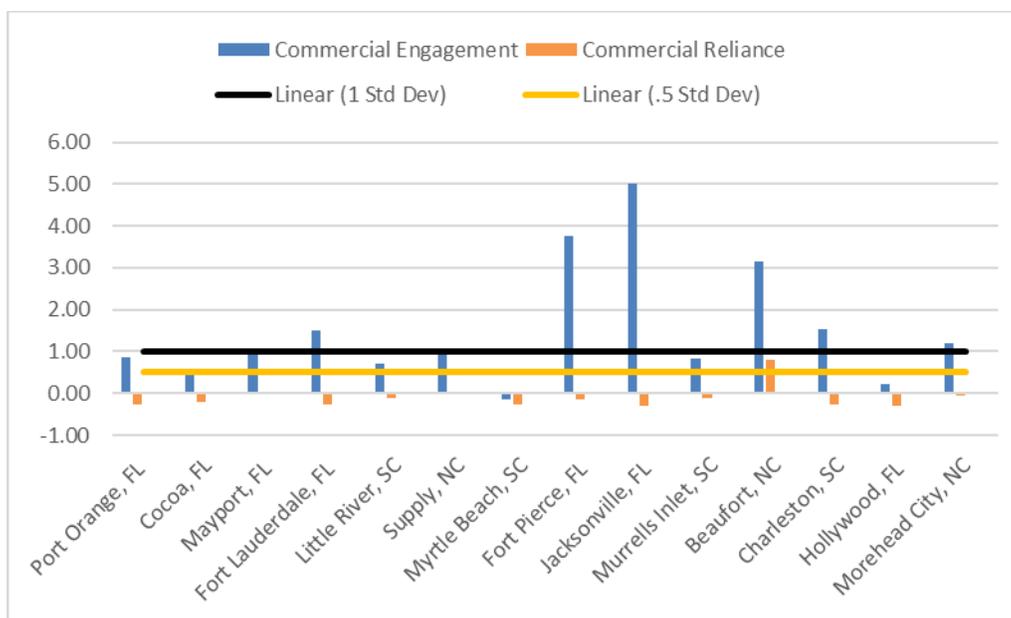

Figure 3.4.1.5. Commercial fishing engagement and reliance for top greater amberjack communities.

Source: SERO, Community Social Vulnerability Indicators Database 2019.

3.4.2. Recreational Sector

3.4.2.1. Landings by State

The greatest proportion of recreational greater amberjack landings came from waters adjacent to Florida and Georgia (average of 79.6% from 2015-2019, SEFSC MRIP FES Recreational ACL Dataset), followed by North Carolina (13.3%), and South Carolina (7.1%). The landings for Florida and Georgia are combined because of the manner in which headboat landings are reported for confidentiality.

3.4.2.2. Permits

The majority of for-hire snapper grouper permits are issued to individuals in Florida (63.3%), followed by North Carolina (17.2%), South Carolina (8.8%), and Georgia (2.5%, SERO Permits Office, April 8, 2021). Residents of other Gulf states (Alabama, Mississippi, Louisiana, and Texas) also hold a sizable amount of for-hire snapper grouper permits (2.5%). Residents of other states and territories (Arkansas, California, Delaware, Iowa, Illinois, Indiana, Massachusetts, Maryland, Maine, Michigan, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania, Puerto Rico, Rhode Island, and Virginia) also hold for-hire snapper grouper permits.

South Atlantic for-hire snapper grouper permits are held by those with mailing addresses in 429 communities (SERO Permits Office, April 8, 2021). Communities with the most for-hire snapper grouper permits are located in communities in Florida, North Carolina, and South Carolina (Table 3.4.2.1). A large number of communities with the most for-hire snapper grouper permits are located in the Florida Keys (Key West, Marathon, Islamorada, Tavernier, Summerland Key, and Key Largo). The communities with most South Atlantic for-hire snapper

grouper permits are Key West (8.4% of for-hire snapper grouper permits), Marathon (3%), and Islamorada, Florida (2.9%).

Table 3.4.2.1. Top communities by number of South Atlantic for-hire snapper grouper permits.

Source: SERO Permits Office, April 8, 2021.

3.4.2.3. Engagement and Reliance

Landings for the recreational sector are not available by species at the community level, making it difficult to identify communities as dependent on recreational fishing for greater amberjack. Because limited data are available concerning how communities are engaged and reliant on specific species in the recreational sector, indices were created using secondary data from permit and infrastructure information for the southeast recreational fishing sector at the community level (Jacob et al. 2013; Jepson and Colburn 2013). Recreational fishing engagement is represented by the number of recreational permits and vessels designated as “recreational” by homeport and owner address. Fishing reliance includes the same variables as fishing engagement, divided by population. Factor scores of both engagement and reliance were plotted by community.

Figure 3.4.2.1 identifies the top communities that are engaged and reliant upon recreational fishing in general. All included communities demonstrate high levels of recreational engagement. Four communities (Islamorada, Florida; Hatteras, North Carolina; Tavernier, Florida; and Manteo, North Carolina) demonstrate high levels of recreational reliance.

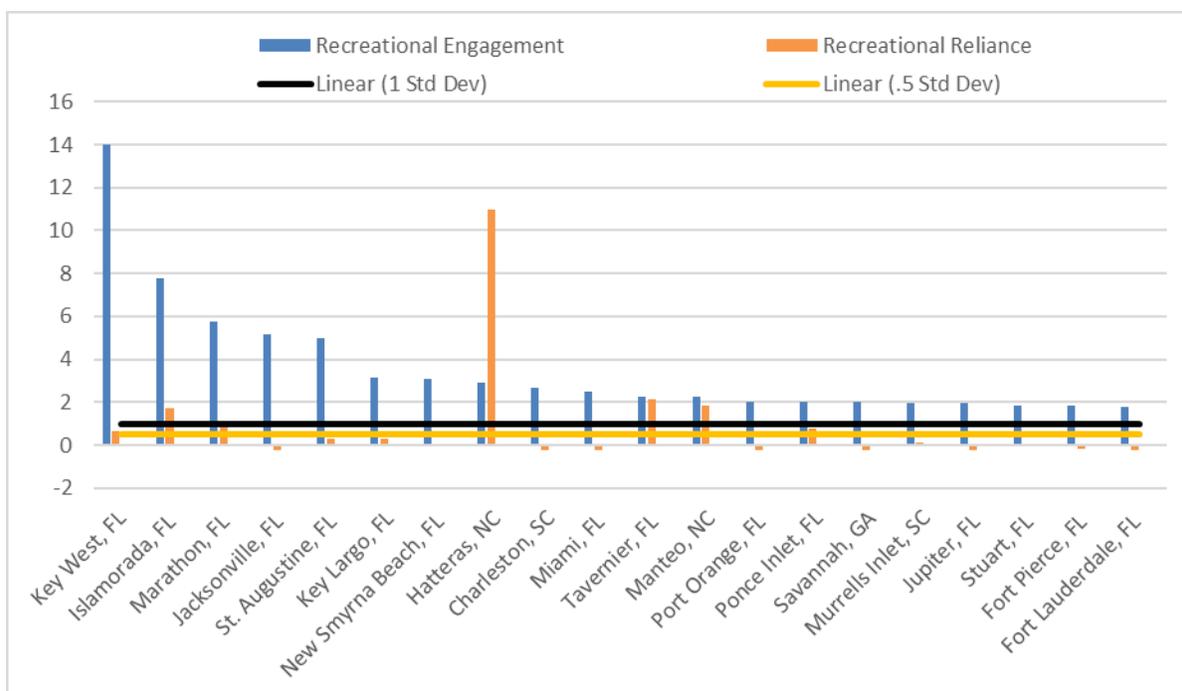

Figure 3.4.2.1. Top 20 communities by recreational fishing engagement and reliance. Source: SERO, Community Social Vulnerability Indicators Database 2019.

The description of fishing activities presented here highlights which communities may be most involved in South Atlantic greater amberjack fishing and snapper grouper fishing. It is expected that the impacts from the regulatory action in this amendment, whether positive or negative, will most likely affect those communities identified above.

3.4.3. Environmental Justice

Executive Order (E.O.) 12898 (1994) requires federal agencies conduct their programs, policies, and activities in a manner to ensure individuals or populations are not excluded from participation in, or denied the benefits of, or subjected to discrimination because of their race, color, or national origin, which is referred to as “environmental justice” (EJ). In addition, and specifically with respect to subsistence consumption of fish and wildlife, federal agencies are required to collect, maintain, and analyze information on the consumption patterns of populations who principally rely on fish and/or wildlife for subsistence. The main focus of E.O. 12898 is to consider “the disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States and its territories...”

Information is available concerning communities overall status with regard to minorities and poverty (e.g., census data). To help assess whether any EJ concerns may be present within regional communities, a suite of indices were created to examine the social vulnerability of coastal communities within the region. The three indices are poverty, population composition, and personal disruptions. The variables included in each of these indices have been identified through the literature as being important components that contribute to a community’s vulnerability. Indicators such as increased poverty rates for different groups, more single

female-headed households and households with children under the age of five, disruptions such as higher separation rates, higher crime rates, and unemployment all are signs of populations experiencing vulnerabilities. Again, for those communities that exceed the threshold it would be expected that they would exhibit vulnerabilities to sudden changes or social disruption that might accrue from regulatory change.

Figures 3.4.3.1 and 3.4.3.2 provide the social vulnerability of the top communities by commercial and recreational snapper grouper permits, RQ of commercial greater amberjack, and recreational fishing engagement and reliance. One community exceeds the threshold of one standard deviation above the mean for all three indices, Fort Pierce, Florida. Two other communities exceed the threshold of one standard deviation above the mean for at least one of the indices (Hialeah, Florida and Miami, Florida). These communities would be the most likely to exhibit vulnerabilities to social or economic disruption due to negative impacts from regulatory change.

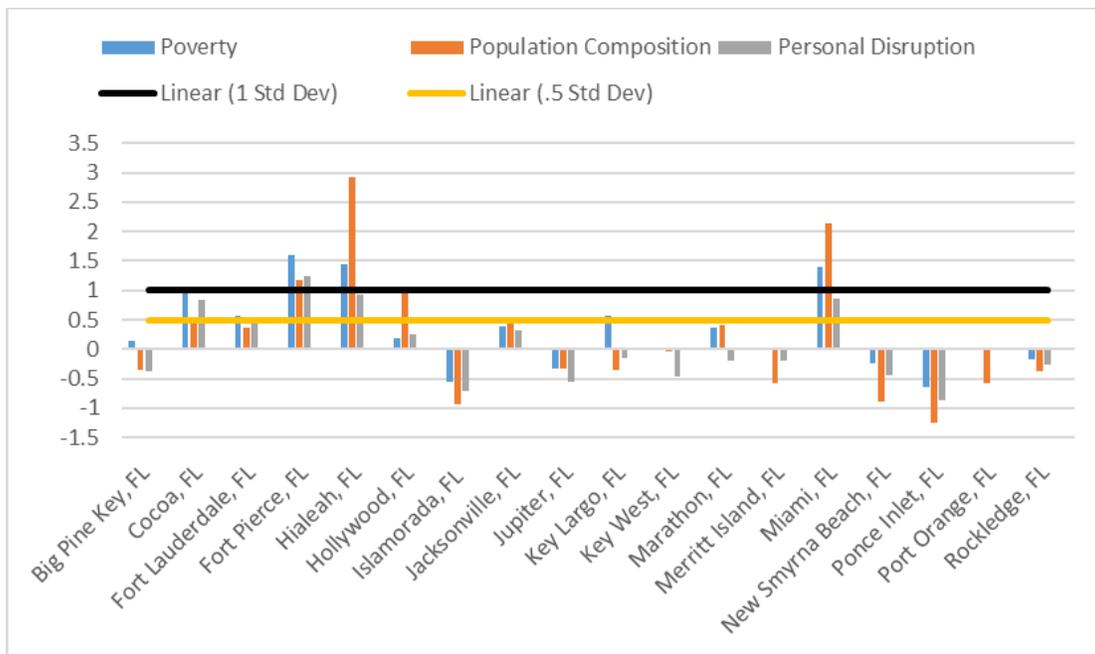

Figure 3.4.3.1. Social vulnerability indices for top snapper grouper and greater amberjack communities.

Source: SERO, Community Social Vulnerability Indicators Database 2018.

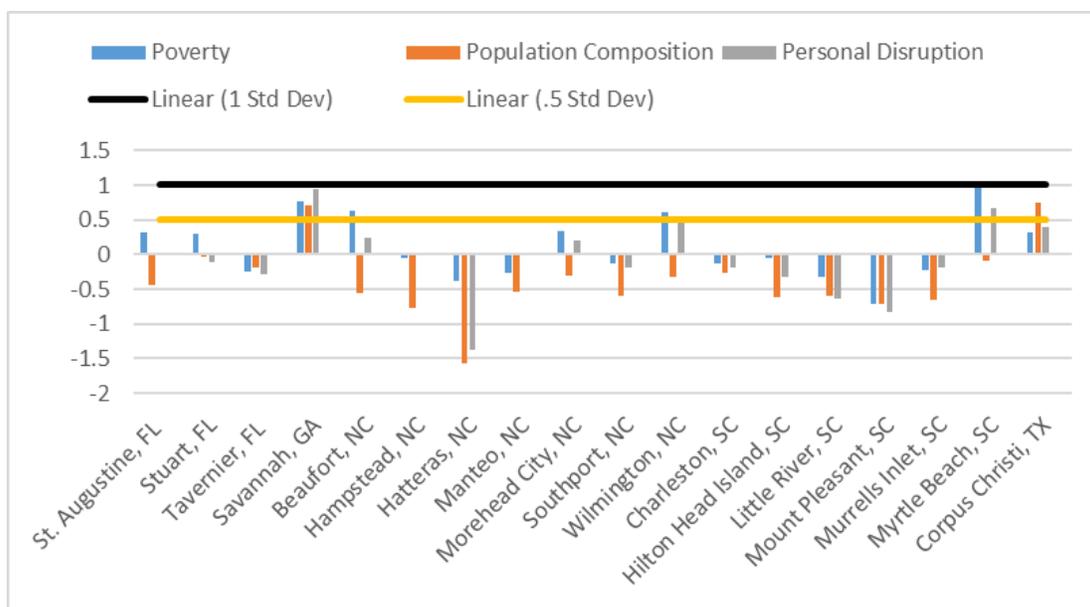

Figure 3.4.3.2. Social vulnerability indices for top snapper grouper and greater amberjack communities continued.

Source: SERO, Community Social Vulnerability Indicators Database 2018.

People in these communities may be affected by fishing regulations in two ways: participation and employment. Although these communities may have the greatest potential for EJ concerns, complete data are not available on the race and income status for those involved in the local fishing industry (employment), or for their dependence on greater amberjack specifically (participation). Although no EJ issues have been identified in this amendment, the absence of potential EJ concerns cannot be assumed.

3.5. Administrative Environment

3.5.1. Federal Fishery Management

Federal fishery management is conducted under the authority of the Magnuson-Stevens Act (16 U.S.C. 1801 et seq.), originally enacted in 1976 as the Fishery Conservation and Management Act. The Magnuson-Stevens Act claims sovereign rights and exclusive fishery management authority over most fishery resources within the EEZ, an area extending 200 nm from the seaward boundary of each of the coastal states, and authority over U.S. anadromous species and continental shelf resources that occur beyond the U.S. EEZ.

Responsibility for federal fishery management decision-making is divided between the U.S. Secretary of Commerce (Secretary) and eight regional fishery management councils that represent the expertise and interests of constituent states. Regional councils are responsible for preparing, monitoring, and revising management plans for fisheries needing management within their jurisdiction. The Secretary is responsible for collecting and providing the data necessary for the councils to prepare fishery management plans and for promulgating regulations to implement proposed plans and amendments after ensuring that management measures are

consistent with the Magnuson-Stevens Act and with other applicable laws. In most cases, the Secretary has delegated this authority to NMFS.

The Council is responsible for conservation and management of fishery resources in federal waters of the U.S. South Atlantic. These waters extend from 3 to 200 mi offshore from the seaward boundary of North Carolina, South Carolina, Georgia, and east Florida to Key West. The Council has thirteen voting members: one from NMFS; one each from the state fishery agencies of North Carolina, South Carolina, Georgia, and Florida; and eight public members appointed by the Secretary. On the Council, there are two public members from each of the four South Atlantic States. Non-voting members include representatives of the U.S. Fish and Wildlife Service, U.S. Coast Guard (USCG), State Department, and Atlantic States Marine Fisheries Commission (ASMFC). The Council has adopted procedures whereby the non-voting members serving on the Council Committees have full voting rights at the Committee level but not at the full Council level. The Council also established two voting seats for the Mid-Atlantic Council on the South Atlantic Mackerel Committee. Council members serve three-year terms and are recommended by state governors and appointed by the Secretary from lists of nominees submitted by state governors. Appointed members may serve a maximum of three consecutive terms.

Public interests also are involved in the fishery management process through participation on Advisory Panels and through council meetings, which, with few exceptions for discussing personnel and legal matters, are open to the public. The Council uses its Scientific and Statistical Committee (SSC) to review the data and science being used in assessments and fishery management plans/amendments. In addition, the regulatory process is in accordance with the Administrative Procedure Act, in the form of “notice and comment” rulemaking.

3.5.2. State Fishery Management

The state governments of North Carolina, South Carolina, Georgia, and Florida have the authority to manage fisheries that occur in waters extending three nautical miles from their respective shorelines. North Carolina’s marine fisheries are managed by the Marine Fisheries Division of the North Carolina Department of Environmental Quality. The Marine Resources Division of the South Carolina Department of Natural Resources manages South Carolina’s marine fisheries. Georgia’s marine fisheries are managed by the Coastal Resources Division of the Department of Natural Resources. The Division of Marine Fisheries Management of the Florida Fish and Wildlife Conservation Commission is responsible for managing Florida’s marine fisheries. Each state fishery management agency has a designated seat on the Council. The purpose of state representation at the Council level is to ensure state participation in federal fishery management decision-making and to promote the development of compatible regulations in state and federal waters.

The South Atlantic states are also involved through ASMFC in management of marine fisheries. This commission was created to coordinate state regulations and develop management plans for interstate fisheries. It has significant authority, through the Atlantic Striped Bass Conservation Act and the Atlantic Coastal Fisheries Cooperative Management Act, to compel adoption of

complementary state regulations to conserve coastal species. The ASFMC is also represented at the Council but does not have voting authority at the Council level.

NMFS's State-Federal Fisheries Division is responsible for building cooperative partnerships to strengthen marine fisheries management and conservation at the state, inter-regional, and national levels. This division implements and oversees the distribution of grants for two national (Inter-jurisdictional Fisheries Act and Anadromous Fish Conservation Act) and two regional (Atlantic Coastal Fisheries Cooperative Management Act and Atlantic Striped Bass Conservation Act) programs. Additionally, it works with the ASMFC to develop and implement cooperative State-Federal fisheries regulations.

3.5.3. Enforcement

Both the NMFS Office for Law Enforcement (NOAA/OLE) and the USCG have the authority and the responsibility to enforce Council regulations. NOAA/OLE agents, who specialize in living marine resource violations, provide fisheries expertise and investigative support for the overall fisheries mission. The USCG is a multi-mission agency, which provides at sea patrol services for the fisheries mission.

Neither NOAA/OLE nor the USCG can provide a continuous law enforcement presence in all areas due to the limited resources of NOAA/OLE and the priority tasking of the USCG. To supplement at sea and dockside inspections of fishing vessels, NOAA entered into Cooperative Enforcement Agreements with all but one of the states in the Southeast Region (North Carolina), which granted authority to state officers to enforce the laws for which NOAA/OLE has jurisdiction. In recent years, the level of involvement by the states has increased through Joint Enforcement Agreements, whereby states conduct patrols that focus on federal priorities and, in some circumstances, prosecute resultant violators through the state when a state violation has occurred.

The NOAA Office of General Counsel Penalty Policy and Penalty Schedule is available online at <http://www.gc.noaa.gov/enforce-office3.html>.

Chapter 4. Environmental Effects and Comparison of Alternatives

4.1. Action 1. Revise the greater amberjack overfishing limit, acceptable biological catch, total annual catch limit, and annual optimum yield

Preferred Alternative 2 for Action 1: Revised OFL, and ABC=ACL=OY with implementation in the late 2022-2023 or 2023 to 2024 fishing year.

4.1.1. Biological Effects

Expected effects to greater amberjack

The current overfishing limit (OFL) for greater amberjack is 2,005,000 pounds whole weight. The current combined commercial and recreational annual catch limit (ACL) is 1,968,001 pounds (lbs) whole weight (ww). The ACL is based on the South Atlantic Fishery Management Council's (Council) Scientific and Statistical Committee's (SSC) previous acceptable biological catch (ABC) recommendation. The current ABC incorporates recreational landings for greater amberjack that were tracked using Marine Recreational Fishery Statistics Survey (MRFSS) estimation methods. Therefore, **Alternative 1 (No Action)** is not a viable alternative because it would retain the current OFL, total ACL for greater amberjack (equal to the current ABC), and optimum yield (OY), which is not based on the best scientific information available (BSIA).

The ACLs in **Preferred Alternative 2**, and **Alternatives 3** through **4**, are based on the SSC's new OFL and ABC recommendations and are viable alternatives for further analysis (Table 1.6.1 and Table 4.1.1.1). The larger catch level recommendation from the Council's SSC are due to an improved condition of the stock as well as a change in the recreational survey from MRFSS to the Marine Recreational Information Program (MRIP) Fishing Effort Survey (FES). Historical landings by sector, and revised sector ACLs, for greater amberjack are discussed in Action 2. Revising greater amberjack catch levels as proposed in **Preferred Alternative 2**, and **Alternatives 3** and **4**, would not be expected to result in negative biological impacts since overall catch would be constrained to the ACL and accountability measures (AM) would prevent the ACL) from being exceeded, correct for overages if they occur (if the stock is in an overfished condition), and prevent overfishing. In addition, the proposed increase in the total ACL for greater amberjack is based on the SSC's recommended OFL and ABC for greater amberjack in the South Atlantic region, and is considered best scientific information available (BSIA).

Alternatives

1. (No Action). Maintain current OFL. The total ACL for greater amberjack is equal to the current ABC.
- 2. Revise the OFL and ABC. The total ACL for greater amberjack is equal to the SSC recommended ABC.**
3. Revise the OFL and ABC. The total ACL for greater amberjack is equal to 90% of the SSC recommended ABC.
4. Revise the OFL and ABC. The total ACL for greater amberjack is equal to 80% of the SSC recommended ABC.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

SEDAR 59 (2020) indicates that the greater amberjack ACL can be increased without having negative effects on the sustainability of the stock.

Table 4.1.1.1. South Atlantic greater amberjack new OFL and ABC recommendations in lbs ww, based on projections from SEDAR 59 (2020), and Total ACL options for Preferred Alternative 2 and Alternatives 3-4. The assessment and these projections use recreational data calibrated to the MRIP FES. Fishing years are from March through the end of February.

Fishing Year	OFL (lbs ww)	Preferred Alternative 2 ABC = Total ACL (lbs ww)	Alternative 3 Total ACL = 90%ABC (lbs ww)	Alternative 4 Total ACL = 80%ABC (lbs ww)
2022-2023	4,615,000	4,380,000	3,942,000	3,504,000
2023-2024	3,283,000	3,233,000	2,909,700	2,586,400
2024-2025	2,839,000	2,818,000	2,536,200	2,254,400
2025-2026	2,719,000	2,699,000	2,429,100	2,159,200
2026-2027+	2,691,000	2,669,000	2,402,100	2,135,200

NOTE: Proposed ACLs are based on recreational data calibrated to the FES. Future recreational catches under these limits would be monitored by the MRIP using the FES.

Greater amberjack commercial landings have remained fairly steady from 1986 through 2019, with a downward trend in recent years (Figure 4.1.1.1). Recreational landings as estimated with both MRFSS and MRIP FES methodologies were very high when record-keeping began and have been sporadic since 1986.

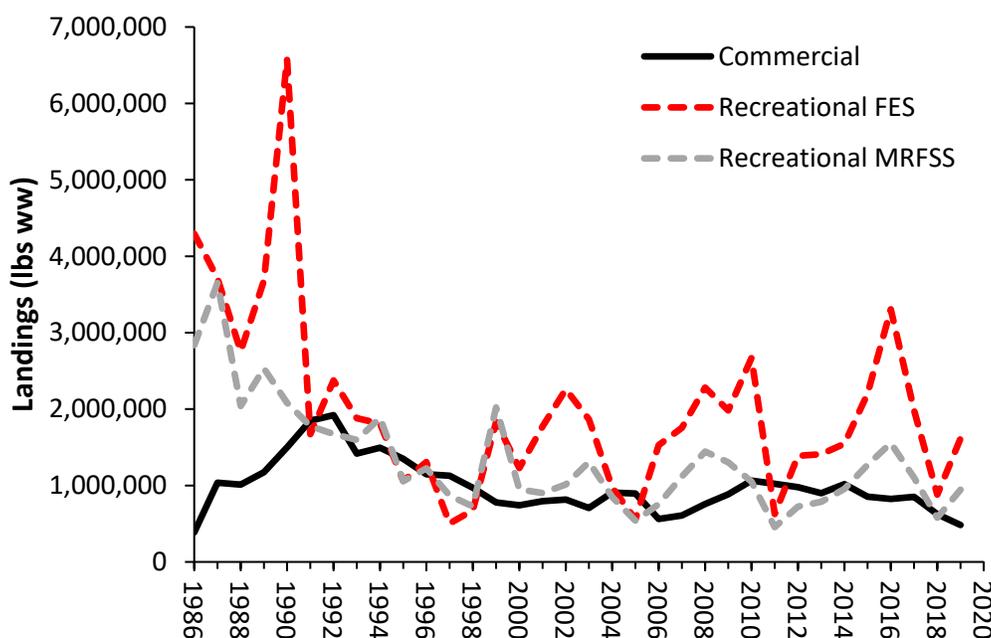

Figure 4.1.1.1. Greater amberjack commercial and recreational landings (lbs ww) by year from 1986 through 2019. Commercial landings using data or methods from SEDAR 59 are in black.

Recreational landings estimates based on the MRFSS are in gray and revised recreational landings estimates based on the FES are in red.

Sources: SEDAR 59 Assessment Report (2020), Southeast Fisheries Science Center (SEFSC) MRFSS Recreational ACL datasets (5/19/20; 9/15/20), SEFSC MRIP FES Recreational ACL dataset (9/16/20)

Alternatives 3 and 4 would have greater long-term positive biological effects than **Preferred Alternative 2** because they would create a buffer between the ACL/annual OY and ABC, with **Alternative 4** setting the most conservative buffer at 80% of the ABC. Specifying a buffer between the ACL/annual OY and ABC, as proposed under **Alternatives 3 and 4**, would provide greater assurance that overfishing is prevented, and the long-term average biomass is near or above SSB_{MSY} . **Preferred Alternative 2** would set the ACL and annual OY equal to the ABC leaving no buffer between the two harvest parameters, which may increase risk that harvest could exceed the ABC. However, the Council's ABC Control Rule accounts for scientific uncertainty. The Magnuson-Stevens Fishery Conservation and Management Act's National Standard 1 (NS 1) guidelines indicate an ACL may typically be set very close to the ABC. Setting a buffer between the ACL and ABC would be appropriate in situations where there is uncertainty in whether management measures are constraining fishing mortality to target levels. Since **Alternative 1 (No Action)** does not incorporate the recent stock assessment (SEDAR 59 2020), and no longer represents BSIA, it is not a viable alternative. When totaling the annual ACL from 2022 through 2027, **Alternative 4** has the lowest cumulative ACL which is expected to have the greatest biological benefits to the stock, followed by **Alternative 3**, and **Preferred Alternative 2**.

Expected Effects to Bycatch and Discards

When compared to **Alternative 1 (No Action)**, increasing the total ACLs under each of **Preferred Alternative 2** and **Alternatives 3 and 4** would allow for more fish to be harvested and reduce the likelihood of in-season closures. Therefore, it is expected that there would be a decrease in regulatory discards because more fish can be kept rather than discarded, which is indirectly beneficial to the greater amberjack stock. However, since it is estimated that South Atlantic greater amberjack have a low release mortality rate of 20% (sensitivity range: 10-30%) (SEDAR 15 2008 and SEDAR 59 2020), any dead discards are expected to be minimal. See Appendix G (BPA) for information on bycatch and discards. Additionally, substantial changes in fishing effort or behavior are not expected as a result of this action, thus the proposed ACLs under this action would not be expected to result in any biological effects, positive or negative, on co-occurring species (refer to BPA in Appendix G).

Expected Effects to Protected Species and Essential Fish Habitat

The alternatives under this action would not significantly modify the way in which the snapper grouper fishery is prosecuted in terms of gear types used, and would not alter fishing behavior in a way that would cause new effects to listed species or critical habitat that were not considered in the previous consultations or that will be considered in the reinitiated consultation. The proposed action is not expected to increase overall effort in the snapper-grouper fishery or alter fishing behavior to the extent that additional listed species interactions would result. Therefore, there are no additional impacts on ESA-listed species or designated critical habitats anticipated

as a result of this action (see Sections 3.1 and 3.2 for a detailed description of ESA-listed species and critical habitat in the action area). Furthermore, no adverse impacts on essential fish habitat (EFH) or EFH-Habitat Areas of Particular Concern are expected to result from any of the alternatives considered for this action (see Section 3.1 and Appendix D for access to detailed descriptions of EFH in the South Atlantic region).

These predicted effects on EFH and ESA-listed species and designated critical habitats are applicable to all actions in this amendment.

4.1.2. Economic Effects

In general, ACLs that allow for more fish to be landed can result in increased positive economic effects if harvest increases without notable long-term effects on the health of a stock. The ACL does not directly impact the fishery for a species unless harvest changes, fishing behavior changes, or the ACL is exceeded, thereby potentially triggering AMs such as harvest closures or other restrictive measures. As such, ACLs that are set above the observed landings in the fishery for a species and do not change harvest or fishing behavior may not have realized economic effects each year. Nevertheless, ACLs set above observed harvest levels do create a gap between the ACL and typical landings that may be utilized in years of exceptional abundance or accessibility to a species, thus providing the opportunity for increased landings and a reduced likelihood of triggering restrictive AMs. As such, there are potential economic benefits from ACLs that allow for such a gap. The opposite is true for ACLs that constrain harvest or fishing effort within a fishery or reduce the previously described gap between average landings and the ACL.

As noted in Section 4.1.1, **Alternative 1 (No Action)** is not a viable alternative. Although not viable since it does not implement BSIA, **Alternative 1 (No Action)** would not be expected to be constraining on harvest when compared to recent 5-year average landings. The ACL is set equal to the ABC in **Alternative 1 (No Action)** and **Preferred Alternative 2**, with the differences between the two in part occurring due to the current versus updated ABC and how the non-headboat recreational component of the total ACL would be accounted for moving forward. Specifically, the current ABC is inclusive of MRFSS-scaled estimates to account for private recreational and charter landings while the updated ABC would be inclusive of MRIP FES estimates for these landings. Projections that allow for conversion between both units for the recreational sector are not available, as there is no forward-looking conversion between the two estimates. As such, a direct comparison of **Alternative 1 (No Action)** to **Preferred Alternative 2** is not possible. This applies to comparisons of **Alternative 1 (No Action)** to **Alternatives 3** and **4** as well, since these two alternatives also incorporate the updated ABC and thus MRIP FES estimates. As a proxy for the status quo (**Alternative 1 (No Action)**), the five-year (2015/16 - 2019/20) average landings of greater amberjack are compared to **Preferred Alternative 2**, **Alternative 3**, and **Alternative 4** to estimate the economic effects of each alternative.

For analysis purposes, the action considered is not likely to go into place in time to notably affect the 2022-2023 fishing year. As such, analyses of the economic effects of this action begin with

the 2023-2024 fishing year, which is the first full or almost full fishing year that regulation changes occurring from this action would likely be implemented. The potential revised total ACLs for greater amberjack when initially implemented in **Preferred Alternative 2** and **Alternative 3** are higher than the 5-year average observed landings in recent years (Table 4.1.2.1; Table 4.1.2.2), thus there would be room for an expansion in landings and associated economic benefits. **Alternative 4** would be constraining on harvest and there would be an associated estimated decrease in economic benefits from this alternative when initially implemented. Five-year average landings from the 2015-2016 to the 2019-2020 fishing years was used as a baseline in this analysis since the 2019-2020 fishing year was the most recent year that total landings (commercial and recreational) data were available when these analyses were prepared. While recreational landings data for 2020-2021 were available at the time, commercial landings and logbook data for this fishing year were not available. Thus, 2019-2020 was chosen as the terminal year for both sectors to provide a proper comparison of landings that rely on the same timeline.

Table 4.1.2.1. South Atlantic greater amberjack landings for fishing years 2015-2016 to 2019-2020.

Fishing Year	Commercial landings (lbs ww)	Recreational landings^a (lbs ww)	Total landings (lbs ww)
2015-2016	940,005	2,773,589	3,713,594
2016-2017	793,308	2,773,177	3,566,485
2017-2018	1,046,174	1,938,506	2,984,680
2018-2019	686,915	1,115,270	1,802,185
2019-2020	430,189	1,528,402	1,958,591
5-year average	779,318	2,025,789	2,805,107

^aRecreational landings are inclusive of FES estimates.

Table 4.1.2.2. Percent difference between the total ACLs in Action 1 compared to 5-year average landings from fishing years 2015-2016 to 2019-2020^a.

Fishing Year	Percent difference between the ACL and 5-year average annual landings for Preferred Alternative 2	Percent difference between the ACL and 5-year average annual landings for Alternative 3	Percent difference between the ACL and 5-year average annual landings for Alternative 4
2023-2024	15%	4%	-8%
2024-2025	0%	-10%	-20%
2025-2026	-4%	-13%	-23%
2026-2027+	-5%	-14%	-24%

^a**Alternative 1 (No Action)** is tracked in part using MRFSS estimates for charter and private recreational landings while **Alternatives 2 (Preferred)** through **4** would be tracked in part using FES estimates for charter and private recreational landings. Charter and private recreational landings make up a notable portion of greater amberjack landings. As such, the economic effects of **Alternative 1 (No Action)** cannot be compared in a quantitative manner to the other alternatives since the accounting methods used to track the MRFSS and FES are vastly different and are not comparable. Thus, **Alternative 1 (No Action)** cannot be considered in this analysis.

In later years, the total ACL would be constraining on harvest as the ACL decreases and this would result in direct negative economic effects from decreased harvest and an associated decrease in economic benefits, assuming harvest is capped at the total ACL. **Alternative 4** would provide the lowest total ACL and thus would be expected to constrain harvest sooner and more severely limit harvest in subsequent years, thus there would be elevated negative economic effects anticipated from this restricted harvest. **Alternative 3** offers a higher ACL and would not be expected to be constraining on harvest until the 2024-2025 fishing year. **Preferred Alternative 2** would provide the highest ACL of the viable alternatives being considered and would not be constraining on harvest until the 2025-2026 fishing year. From an economic benefits perspective, **Alternative 1 (No Action)** would provide the highest short-term economic benefits, since it is not constraining on harvest but this alternative is not viable. **Preferred Alternative 2** would provide the highest potential economic benefits of the viable alternatives being considered followed by **Alternative 3** and **Alternative 4** (Table 4.1.2.2).

The estimated change in potential landings by sector under **Preferred Alternative 2** through **Alternative 4** are provided in Table 4.1.2.3 and Table 4.1.2.5. Table 4.1.2.4 and Table 4.1.2.6 show the resulting estimated change in net economic benefits by sector and Table 4.1.2.7 shows the estimated change in net economic benefits for **Action 1** in aggregate for both sectors combined. In the 2023-2024 fishing year, **Preferred Alternative 2** is estimated to result in an increase in potential net economic benefits of \$309,861 for the commercial sector, a decrease in potential net economic benefits of \$71,606 for the recreational sector, and an increase in potential net economic benefits of \$238,255 for both sectors combined (2020 \$). By the 2026-2027 fishing year and beyond, **Preferred Alternative 2** is estimated to result in an increase in potential net economic benefits of \$171,716 for the commercial sector, a decrease in potential net economic benefits of \$294,895 for the recreational sector, and a decrease in potential net economic benefits of \$123,178 for both sectors combined (2020 \$).

Table 4.1.2.3. Estimated change in potential landings (lbs ww) to the commercial sector from Action 1.

Fishing Year	Preferred Alternative 2	Alternative 3	Alternative 4
2023-2024	514,374	382,921	251,467
2024-2025	345,635	231,055	116,476
2025-2026	297,250	187,509	77,767
2026-2027+	285,052	176,530	68,009

2025-2026	-\$283,017	-\$389,871	-\$496,725
2026-2027+	-\$294,895	-\$400,561	-\$506,227

Table 4.1.2.7. Estimated change in potential net economic benefits (recreational and commercial combined) from **Action 1** (2020 \$)^a.

Fishing Year	Preferred Alternative 2	Alternative 3	Alternative 4
2023-2024	\$238,255	\$31,072	-\$176,112
2024-2025	-\$27,693	-\$208,282	-\$388,870
2025-2026	-\$103,953	-\$276,916	-\$449,878
2026-2027+	-\$123,178	-\$294,218	-\$465,258

^a**Alternative 1 (No Action)** is tracked in part using MRFSS estimates for charter and private recreational landings while **Alternatives 2 (Preferred)** through **4** would be tracked in part using FES estimates for charter and private recreational landings. Charter and private recreational landings make up a notable portion of greater amberjack landings. As such, the economic effects of **Alternative 1 (No Action)** cannot be compared in a quantitative manner to the other alternatives since the accounting methods used to track the MRFSS and MRIP FES are vastly different and are not comparable. Thus, **Alternative 1 (No Action)** cannot be considered in this analysis.

Assumptions used in calculating these estimates include application of the status quo allocation of the total ACL (40.66% commercial, 59.34% recreational) to the new ACL for each alternative to estimate economic benefits. This allocation is then compared to the baseline scenario (i.e., a proxy for **Alternative 1 (No Action)**) to determine the gap between the baseline scenario and the ACL by sector under the assumption that both sectors would fully harvest their respective ACLs. For the commercial sector, the current sector ACL of 769,388 lbs gutted weight (gw) is used as

the baseline scenario since the units measuring this portion of the total ACL are not changing due to this action. For the recreational sector, 5-year average landings (2015/2016-2019/2020) in FES terms are used as the baseline scenario since a forward looking conversion of MRFSS and MRIP FES units is not available that would allow direct comparison of the current recreational sector ACL under **Alternative 1 (No Action)**, which is in MRFSS terms, to the resulting new recreational sector ACL under **Alternatives 2 (Preferred)** through **4** which are in MRIP FES terms.

To estimate net economic benefits from the commercial portion of the gap between landings and the potential ACL, a ratio of 1.04 is used to convert lbs ww to lbs gw. This allows application of the appropriate price (\$1.79/lbs gw; Tables 3.3.1 and 3.3.2) along with a scaling factor of 35% of gross revenue (Section 3.3.1.2; NMFS SEFSC, pers. comm. 2022) to estimate producer surplus (PS) for the commercial sector. Although there are no currently available estimates of the demand elasticity for greater amberjack, it is assumed that there would be no expected change to consumer surplus (CS) from the commercial perspective since there is likely a high degree of substitutability of greater amberjack for other species. Estimates of net revenues or economic profit are not available for snapper grouper dealers. Therefore, it is not possible to estimate the effect of changes in purchases on their profits. However, in general, dealers are indirectly affected whenever gross revenues to commercial fishing vessels are expected to change (e.g., increases in gross revenues are expected to indirectly benefit dealers and vice versa). Thus, the ranking of economic benefits to dealers would be the same as stated above.

To estimate net economic benefits for the recreational sector, a CS estimate of \$13.11 for a “generic snapper” kept on a recreational trip is used (2020 \$; Section 3.3). This marginal value estimate is used as a proxy value since one is not currently available specifically for greater amberjack. A weight of 19.65 lbs ww per greater amberjack is used to convert the recreational portion of the buffer from lbs ww to numbers of fish (Personal Communication, NOAA Southeast Fisheries Science Center SAFE Dataset, March 17, 2021). It is assumed that changes in the recreational portion of the total ACL would only affect catch per trip and not the overall number of trips taken. This includes no direct change to for-hire fishing activity and thus no change in direct economic effects for the for-hire component of the recreational sector. As such, there are no estimated changes in PS provided for the recreational sector.

4.1.3. Social Effects

The ACL for any stock does not directly affect resource users unless the ACL is met or exceeded, in which case AMs that restrict or close harvest could negatively impact the commercial, for-hire, and private recreational sectors. AMs can have significant direct and indirect social effects because, when triggered, they can restrict harvest in the current season or subsequent seasons. While the negative effects are usually short-term, they may at times induce other indirect effects through changes in fishing behavior or business operations that could have long-term social effects, such as increased pressure on another species, or fishermen having to stop fishing altogether due to regulatory closures. However, restrictions on harvest contribute to sustainable management goals, and are expected to be beneficial to fishermen and communities

in the long term. Generally, the higher the ACL the greater the short-term social benefits that would be expected to accrue if harvest is sustainable.

Under **Preferred Alternative 2** through **Alternative 4**, the ACL for greater amberjack would be based on the most recent stock assessment and updated MRIP FES estimates. Adjustments in an ACL based on updated information are necessary to ensure harvest remains sustainable and fishermen continue to have access to the resource over time. **Alternative 1 (No Action)** would not update the greater amberjack ACL based on current information and would not provide the social benefits associated with accurate accounting of non-headboat recreational harvest.

Commercial and recreational landings are estimated to vary year by year (Figure 4.1.1.1), and projections show that, depending on the sector allocations chosen in Action 2, there could be some years in which recreational landings would be projected to reach their respective ACL and AMs would be triggered (Table 4.2.1.7). There would likely be some negative effects on recreational fishermen and for-hire businesses that target greater amberjack. In general, a higher ACL would lower the chance of triggering a recreational AM and result in the lowest level of negative effects on the recreational sector. Additionally, higher ACLs may provide opportunity for commercial and recreational fishermen to expand their harvest providing social benefits associated with increased income to fishing businesses within the community and higher trip satisfaction.

The communities that would be most affected by a revision to the greater amberjack ABC and ACL are discussed in Section 3.4. Fishing communities in Florida and Georgia consistently experience the highest recreational and commercial landings of greater amberjack, followed by North Carolina and South Carolina. In particular, the community of Port Orange, Florida represents a substantial amount of commercial harvest (17% of landings and 22% of ex-vessel value). As a result, Port Orange is likely to see positive social effects related to increases in income and employment under a higher ACL, especially considering that Port Orange, Florida is moderately engaged in commercial fishing. Mayport, Florida has comparatively lower landings than Port Orange, but it is highly engaged in commercial fishing and may also experience positive social effects from a higher ACL. Similarly, there are a substantial number of for-hire permit holders located in the Florida Keys. Fishing communities within the Florida Keys are likely to also experience benefits of a higher ACL and consistent access to greater amberjack such as increased trips and trip satisfaction, especially if anglers desire to specifically target greater amberjack. Communities in the Florida Keys are all highly engaged in recreational fishing with Islamorada and Marathon also being highly reliant upon the recreational fishing industry.

Among the action alternatives, **Preferred Alternative 2** would be the most beneficial for fishermen, followed by **Alternative 3**, and **Alternative 4**. **Alternative 1 (No Action)** is likely to have similar effects as **Preferred Alternative 2** as the buffer between ACL and ABC remains the same with the accounting of non-headboat recreational harvest updated under **Preferred Alternative 2**. As stated in Section 4.1.1, **Alternative 1 (No Action)** is not a viable alternative because it is not based on BSIA.

4.1.4. Administrative Effects

Compared to **Alternative 1 (No Action)**, none of the Action 1 alternatives under consideration to modify the ABC and total ACLs would result in significant impacts on the administrative environment. Since a total ACL is already in place for greater amberjack, administrative impacts of this action are likely to be minimal. **Alternative 1 (No Action)**, **Preferred Alternative 2**, and **Alternatives 3 and 4** would not result in significant administrative cost or time burdens other than notifying fishery participants of the change in the ACL and continued monitoring of the ACL.

4.2. Action 2. Revise the greater amberjack sector allocations and sector annual catch limits

Preferred Alternative 3 for Action 2 with implementation in the late 2022-2023 or 2023 to 2024 fishing year.

4.2.1. Biological Effects

Expected effects to greater amberjack

Biological effects are not expected to vary among alternatives in **Action 2**, since they do not change the total ACL specified in **Action 1**. Management differences between the commercial and recreational sectors make an overall net biological effect attributable solely to sector allocation difficult to distinguish. The stock gains relatively more biological benefits from the commercial fishery in terms of a closure of that sector during April, when greater amberjack are spawning. The stock gains relatively more biological benefits from the recreational fishery in terms of a lower possession limit (compared to the commercial trip limit). The commercial sector has a larger minimum size limit, which provides biological benefits of reducing catch rates and allowing more juvenile fish to mature and enter the spawning population. The recreational sector has a smaller minimum size limit, which has biological benefits from reducing discard mortality to fish that are undersized. Due to relatively greater benefits from each of the sectors in different aspects of their management, no biological effects are expected to be relatively neutral for the greater amberjack stock based on allocation. Furthermore, effective AMs are in place to prevent the commercial and recreational ACLs from being exceeded. **Alternative 1 (No Action)** through **Alternative 5**, including **Preferred Alternative 3**, include sector allocation percentages, which would be applied to the revised total ACL from Preferred Alternative 2 in Action 1; Table 4.2.1.1).

Alternatives

- 1 (No Action). Retain the current recreational and commercial sector allocations as 59.34% and 40.66%, respectively, of the revised total ACL for greater amberjack.
2. Apply the current allocation formula to the total ACL using the FES-calibrated recreational landings and commercial landings used in SEDAR 59 (2020). This would result in a recreational allocation of 70.16% and a commercial allocation of 29.84%.
- 3. Allocate 65.00% of the total ACL to the recreational sector and 35.00% of the ACL to the commercial sector.**
4. Allocate 55.00% of the total ACL to the recreational sector and 45.00% of the total ACL to the commercial sector.
5. Allocate 50.00% of the total ACL to the recreational sector and 50.00% of the total ACL to the commercial sector.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

Table 4.2.1.1. Sector allocation percentages for South Atlantic greater amberjack that would be applied to the revised total ACL from Preferred Alternative 2 in Action 1.

Alternative	Percent Recreational allocation	Percent Commercial allocation
Alternative 1 (No Action)	59.34%	40.66%
Alternative 2	70.16%	29.84%
Preferred Alternative 3	65.00%	35.00%
Alternative 4	55.00%	45.00%
Alternative 5	50.00%	50.00%

Of the alternatives considered in Action 2, **Alternative 5** would allocate the *highest* percentage of the total ACL to the commercial sector (50.00%), followed by **Alternative 4** (45.00%), **Alternative 1 (No Action)** (40.66%), **Preferred Alternative 3** (35.00%), and **Alternative 2** (29.84%). Conversely, **Alternative 2** would allocate the *highest* percentage of the total ACL to the recreational sector (70.16%), followed by **Preferred Alternative 3** (65.00%), **Alternative 1 (No Action)** (59.34%), **Alternative 4** (55.00%), and **Alternative 5** with the lowest recreational allocation (50.00%).

Section 2.2.1 shows the sector ACLs resulting from applying the sector allocation percentages from **Alternative 1 (No Action)** through **Alternative 5** to the total ACL from **Preferred Alternative 2** in Action 1. Based on the recommended ABC and revised total ACL, the sector ACLs for each alternative proposed under Action 2 are greatest in the 2022-2023 fishing year, and decrease each year until the 2026-2027 fishing year (Table 4.2.1.2).

Table 4.2.1.2. Sector ACLs (lbs ww for recreational and lbs gw for commercial) for greater amberjack based on the revised total ACL from Preferred Alternative 2 in Action 1 and allocation percentages from Preferred Alternative 3 in Action 2 (65.00% recreational and 35.00% commercial). The commercial ACL allocates 60% of the quota to Season 1 and 40% to Season 2.

Year	Total ACL (lbs ww)	Recreational ACL (lbs ww)	Commercial ACL* (lbs gw)	Commercial Season 1 Quota (lbs gw)	Commercial Season 2 Quota** (lbs gw)
2022/2023	4,380,000	2,847,000	1,474,038	884,423	589,615
2023/2024	3,233,000	2,101,450	1,088,029	652,817	435,212
2024/2025	2,818,000	1,831,700	948,365	569,019	379,346
2025/2026	2,699,000	1,754,350	908,317	544,990	363,327
2026/2027+	2,669,000	1,734,850	898,221	538,933	359,288

*The total ACL is allocated in lbs ww to the commercial and recreational sectors. The commercial allocation is then converted to lbs gw for regulatory use in the commercial ACL and seasonal quotas.

**Any remaining quota from commercial Season 1 (March-August) transfers to Season 2 (September-February). Remaining quota from Season 2 is not carried forward.

Commercial Sector Landings and Predicted Closures

Average commercial landings of greater amberjack in the South Atlantic from March 2015 to February 2020 were 685,492 lbs gw (Table 4.2.1.3), or 89.1% of the commercial ACL, with commercial in-season closures occurring during the 2015-16, 2016-17, and 2017-18 fishing years. Landings were highest during the months of March through June, with the exception of April due to the seasonal closure, with a peak in May (Figures 4.2.1.1 and 4.2.1.2).

Table 4.2.1.3. South Atlantic commercial landings (lbs gw) of greater amberjack from March 2014 through February 2020 and percentage of the commercial ACL landed each year. Years with in-season closures due to approaching or exceeding the commercial ACL are indicated with the closure date.

Year	Total Landings (lbs gw)	Commercial ACL (lbs gw)	ACL %	Closure Date
2019-2020	413,643	769,388	53.8	
2018-2019	660,495	769,388	85.8	
2017-2018	1,005,937	769,388	130.7	10/18/17
2016-2017	762,796	769,388	99.1	10/4/16
2015-2016	903,851	769,388	117.5	1/21/16
2014-2015	924,783	769,388	120.2	

Source: SERO Commercial ACL data provided from the SEFSC on September 29, 2021.

*Commercial closure in April for all years.

**2020 landings were considered preliminary.

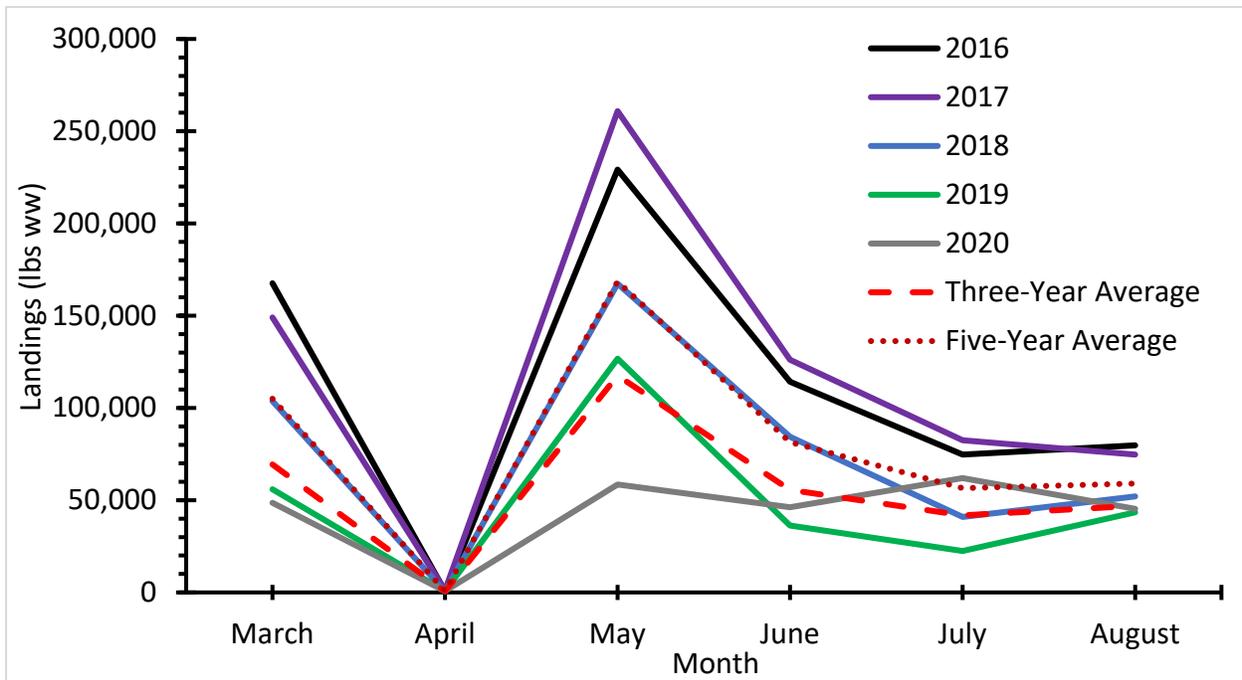

Figure 4.2.1.1. South Atlantic greater amberjack commercial landings (lbs ww) by month through August, with a commercial closure in April, from 2016 to 2020, using a three-year average, and five-year average.

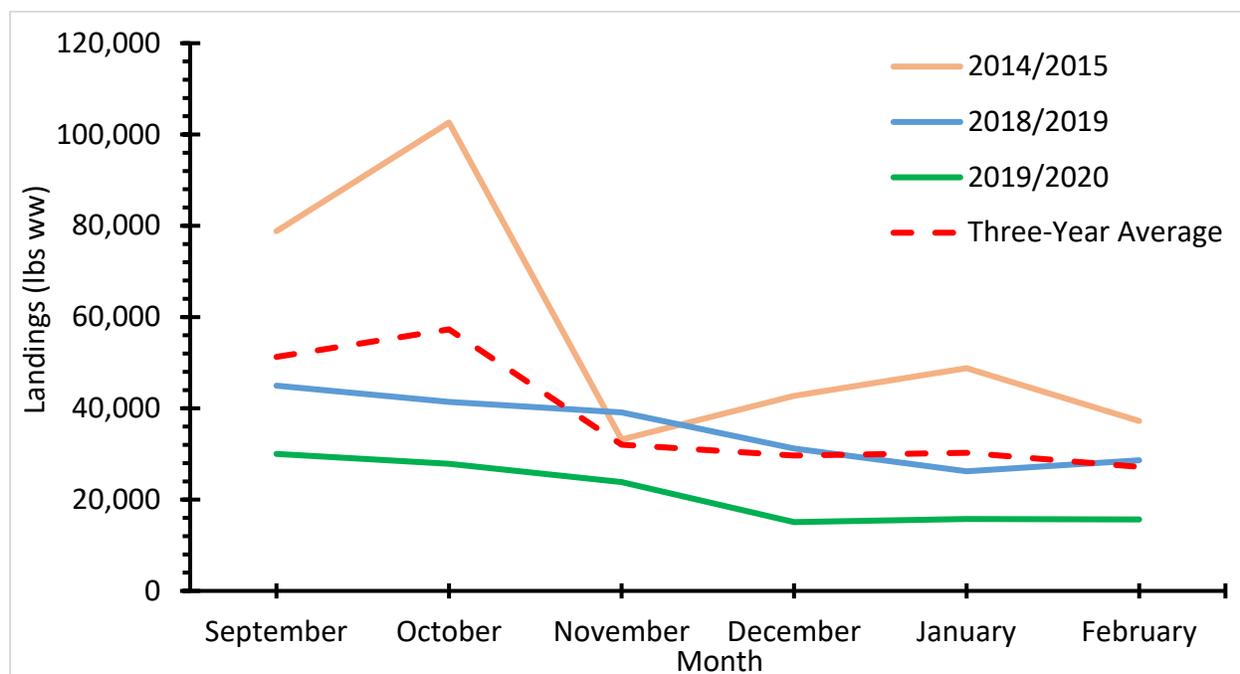

Figure 4.2.1.2. South Atlantic greater amberjack commercial landings (lbs ww) by month for September through February for recent years that did not have a closure, and the three-year average. The three-year average came from the most recent years of complete data (2014/2015, 2018/2019, and 2019/2020).

An analysis of three scenarios¹⁴ comparing when commercial sector landings would reach the proposed commercial sector ACLs for Season 1 are in Table 4.2.1.4. The scenarios, based on a three-year and five-year average and the maximum annual landings during the last five years, reveal that the commercial ACL for greater amberjack is not projected to be reached during Season 1 under **Preferred Alternative 3** for Scenarios 1 and 2. Predicted closure dates for Scenario 3 span from July 1 to no closure needed (Table 4.2.1.4). No closures were predicted for Season 2 for **Preferred Alternative 3** Scenarios 1 and 2 (Table 4.2.1.5.).

¹⁴ For Season 1: The most recent five years of complete data are from the fishing years of 2016 through 2020. These data were used to generate three potential future commercial landings scenarios: 1) three year average of the most recent years of complete data (2018, 2019, and 2020), 2) five year average of the most recent years of complete data (2016 through 2020), and 3) the maximum landings in the last five years of complete data. The year with the maximum commercial landings in season 1 in the last five years is 2017. For Season 2: the years of 2015/2016, 2016/2017, 2017/2018 all had closures that prevented a full six months of an open season 2. The most recent three years of complete data are from the fishing seasons of 2014/2015, 2018/2019, and 2019/2020. These data were used to generate two potential future commercial landings scenarios: 1) three year average of the most recent years of complete data (2014/2015, 2018/2019, and 2019/2020), and, 2) the maximum landings in the last five years. The year with the maximum commercial landings in season 2 in the last five years came from 2014/2015. Scenario 3 could not be used to estimate the closure dates for Season 2 due to recent Season 2 in-season closures, preventing incomplete data. These values can be found in tables F-10 and F-17 in Appendix F.

Table 4.2.1.4. The projected Season 1 commercial closure dates for South Atlantic greater amberjack. These projections assume the total ACLs from Action 1-Preferred Alternative 2 and include the initial (2022-23) and terminal (2026-27) projected fishing years for Action 2.

*Commercial ACLs (lbs ww) for greater amberjack are based on the revised total ACL from Preferred Alternative 2 in Action 1, and Alternative 3 in Action 2.

Recreational Sector Landings and Predicted Closures

Average recreational landings (MRFSS) of greater amberjack in the South Atlantic from March 2015 to February 2020 were 1,037,831 lbs ww (Table 4.2.1.6), or 88.9% of the recreational ACL, with recreational in-season closures occurring during the 2016-17, and 2017-18 fishing seasons. Landings were highest during the months of May through August (Figure 4.2.1.3.).

Table 4.2.1.6. Recreational landings based on the Marine Recreational Fishery Statistics Survey (MRFSS; lbs ww) of greater amberjack from March 2016 through February 2021 and corresponding percentage of recreational ACL landed each year.

Year	Total Landings (lbs ww)	Recreational ACL (lbs ww)	ACL %	Closure Date
2020-2021	615,674	1,167,837	52.7%	
2019-2020	922,221	1,167,837	79.0%	
2018-2019	673,768	1,167,837	57.7%	
2017 - 2018	1,062,659	1,167,837	91.0%	10/31/2017
2016 - 2017	1,411,357	1,167,837	120.9%	11/30/2016

Source: SEFSC MRFSS Recreational ACL dataset [January 10, 2022].

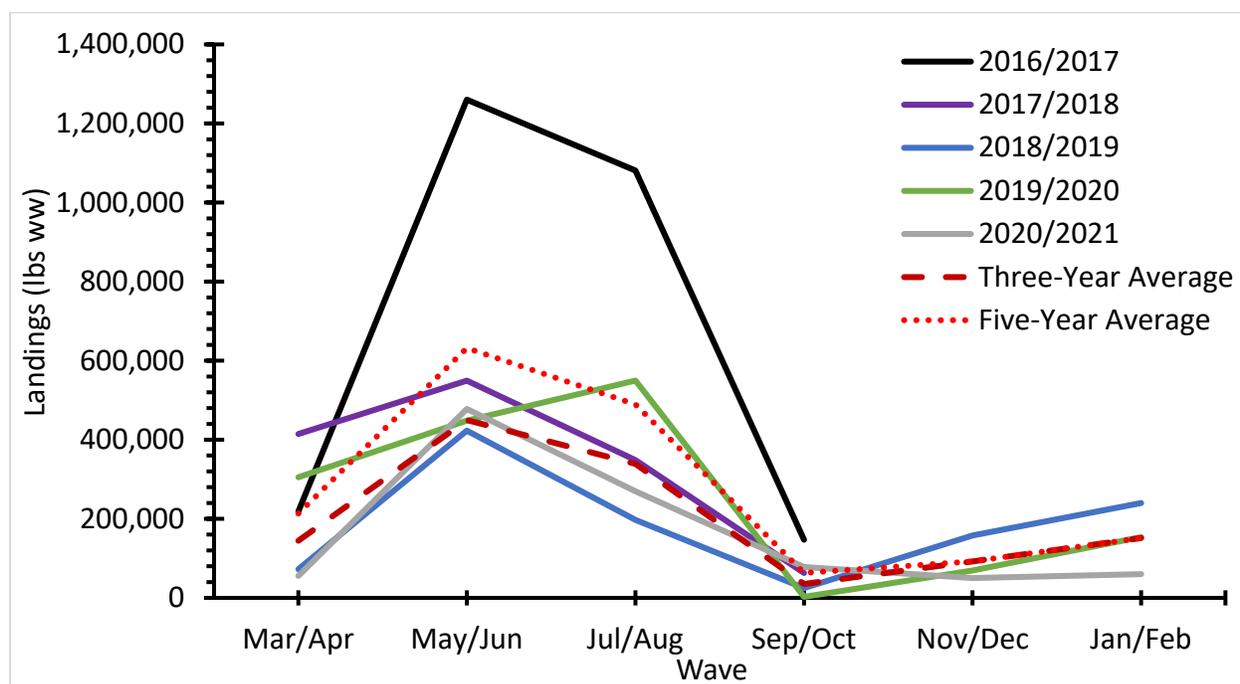

Figure 4.2.1.3. South Atlantic greater amberjack recreational landings (lbs ww) by two-month wave for the 2016/2017 to the 2020/2021 fishing years, and the three-year and five-year average. The fishing years of 2016/2017 and 2017/2018 are not for the full fishing year because these fishing years had recreational closures.

An analysis of three scenarios¹⁵ comparing when recreational sector landings would reach the proposed recreational sector ACLs are in Table 4.2.1.7. The scenarios, based on a three-year and five-year average and the maximum annual landings during the last five years, reveal that the recreational ACL for greater amberjack is projected to be met during dates spanning from May 5 under Scenario 3 to no closure needed. **Preferred Alternative 3** could result in a closure as early as July 15 to no closure needed during the fishing year. No closure dates were predicted for landings under Scenario 1 because the three-year average of the recreational landings generated landings below all of the recreational ACLs provided in Action 2.

Table 4.2.1.7. The projected recreational closure dates for South Atlantic greater amberjack.

Alternative	Year	Recreational ACL (lbs ww)	Scenario 1 Closure Date	Scenario 2 Closure Date	Scenario 3 Closure Date

*Recreational ACLs (lbs ww) for greater amberjack are based on the revised total ACL from Preferred Alternative 2 in Action 1, and Alternative 3 in Action 2.

Expected Effects to Bycatch and Discards

In general, reducing sector allocations results in less landings available to a sector for harvest and increases the likelihood of an in-season closure. Therefore, in-season closures could have

¹⁵ The most recent complete five years of data are from the fishing years of 2016/2017 to 2020/2021. These data were used to generate three potential future recreational landings scenarios: 1) three year average of the most recent years of complete data (2018/2019, 2019/2020, and 2020/2021), 2) five year average of the most recent years of complete data (2016/2017 through 2020/2021), and 3) the maximum landings in the last five years of complete data. The year with the maximum landings in the last five years is the 2016/2017 fishing year. Due to closures in the 2016/2017 fishing year (closed on November 30, 2016) and the 2017/2018 fishing year (closed on October 31, 2017) both landings for scenario 2 and also scenario 3 used the three-year average landings for the November/December and January/February time periods. Table F-1 and Figure F-1 in Appendix F displays the recreational landings used in this analysis.

adverse effects to the stock if discard mortality increases when fish are returned to the water during the closure. However, since it is estimated that South Atlantic greater amberjack have a low release mortality rate of 20% (sensitivity range: 10-30%) (SEDAR 15 2008 and SEDAR 59 2020), should an in-season closure occur, any dead discards are expected to be minimal. See **Appendix G (BPA)** for information on bycatch and discards.

4.2.2. Economic Effects

In general, sector ACLs that allow for more fish to be landed can result in increased positive economic effects if harvest increases without notable long-term effects on the health of a stock. The sector ACL does not directly impact the fishery for a species unless harvest changes, fishing behavior changes, or the sector ACL is exceeded, thereby potentially triggering AMs such as harvest closures or other restrictive measures. As such, sector ACLs that are set above observed landings in a fishery for a species and do not change harvest or fishing behavior may not have realized economic effects each year. Nevertheless, sector ACLs set above observed average harvest levels do create a gap between the sector ACL and typical landings that may be utilized in years of exceptional abundance or accessibility of a species, thus providing the opportunity for increased landings and a reduced likelihood of triggering restrictive AMs. There are potential economic benefits from sector ACLs that allow for such a gap.

Commercial Sector

Alternative 1 (No Action) would maintain the current commercial allocation of 40.66% of the total ACL. **Alternatives 2 and 3 (Preferred)** would result in comparatively lower commercial sector allocations and sector ACLs (29.84% and 35.00% of the total ACL respectively). **Alternatives 4 and 5** would result in comparatively higher commercial sector allocations and sector ACLs (45.00% and 50.00% of the total ACL respectively). Although none of the commercial ACL alternatives in **Action 2** are estimated to be constraining based on the 5-year average annual landings from the 2015/2016 to 2019/2020 fishing years (749,344 lbs gw; Table 4.2.1.3) and are all higher than the current sector ACL of 769,388 lbs gw, it is assumed that the commercial sector could fully harvest its ACL, if conditions allowed, and there would be fewer potential landings of greater amberjack under **Alternative 2** and **Preferred Alternative 3** relative to **Alternative 1 (No Action)**. These relatively reduced landings would be expected to comparatively decrease total potential PS for the commercial sector. Conversely, **Alternative 4** and **Alternative 5** would allow higher potential commercial landings which would comparatively increase total potential PS for the commercial sector (Table 4.2.2.1). When compared to **Alternative 1 (No Action)**, **Alternative 2** would result in the largest estimated reduction in PS of \$210,728 in fishing year 2023/24 and a reduction in PS of \$173,965 by fishing year 2026/27, followed by **Preferred Alternative 3** with an estimated reduction in PS of \$110,233 in fishing year 2023/24 and a reduction in PS of \$91,002 by fishing year 2026/27 (2020 \$). Comparatively, **Alternative 5** would result in the largest estimated increase in PS of \$181,903 in fishing year 2023/24 and an increase in PS of \$150,170 by fishing year 2026/27, followed by **Alternative 4** with an estimated increase in PS of \$84,524 in fishing year 2023/24 and an increase in PS of \$69,779 by fishing year 2026/27 (2020 \$) (Table 4.2.2.2). Estimates of net revenues or economic profit are not available for snapper grouper dealers. Therefore, it is not possible to estimate the effect of changes in purchases on their profits. However, in general,

dealers are indirectly affected whenever gross revenues to commercial fishing vessels are expected to change (e.g., increases in gross revenues are expected to indirectly benefit dealers and vice versa). Thus, the ranking of economic benefits to dealers would be the same as stated above.

Table 4.2.2.1. Percent difference between the commercial sector ACLs in Action 2 compared to 5-year average landings of greater amberjack from fishing years 2015/16-2019/20 and comparison of sector ACLs.

Fishing Year	Commercial sector ACL (lbs gw)	Percent difference between 5-year average landings and the sector ACL	Difference from Alternative 1 (No Action) sector ACL (lbs gw)
Alternative 1 (No Action)			
2023/24	1,263,979	69%	-
2024/25	1,101,730	47%	-
2025/26	1,055,205	41%	-

2024/25	808,549	8%	-293,181
2025/26	774,405	3%	-280,800
2026/27+	765,798	2%	-277,678
Preferred Alternative 3			
2023/24	1,088,029	45%	-175,950
2024/25	948,365	27%	-153,365
2025/26	908,317	21%	-146,888
2026/27+	898,221	20%	-145,255
Alternative 4			
2023/24	1,398,894	87%	134,915
2024/25	1,219,327	63%	117,597
2025/26	1,167,837	56%	112,632
2026/27+	1,154,856	54%	111,380
Alternative 5			
2023/24	1,554,327	107%	290,348
2024/25	1,354,808	81%	253,078
2025/26	1,297,596	73%	242,391
2026/27+	1,283,173	71%	239,697

^aAssumes the total ACL in Preferred Alternative 2 of Action 1 to determine the sector ACL.

Table 4.2.2.2. Estimated change in potential net economic benefits for the commercial sector (PS) from the alternatives in Action 2 compared to Alternative 1 (No Action) (2020 \$).

Fishing Year	Alternative 2	Preferred Alternative 3	Alternative 4	Alternative 5
2023-2024	-\$210,728	-\$110,233	\$84,524	\$181,903
2024-2025	-\$183,678	-\$96,083	\$73,674	\$158,553
2025-2026	-\$175,921	-\$92,025	\$70,564	\$151,858
2026-2027+	-\$173,965	-\$91,002	\$69,779	\$150,170

Assumptions used in calculating the estimates in Table 4.2.2.2 include a comparison of the sector ACL in **Alternative 1 (No Action)** to the appropriate sector ACL resulting from the other alternatives. To estimate the change in potential net economic benefits, the difference in lbs gw is applied to the appropriate price (\$1.79/lbs gw; Tables 3.3.1 and 3.3.2) along with a scaling factor of 35% of gross revenue (Section 3.3.1.2; NMFS SEFSC, pers. comm. 2022) to estimate PS for the commercial sector. Although there are no currently available estimates of the demand elasticity for greater amberjack, it is assumed that there would be no expected change to CS from the commercial perspective since there is likely a high degree of substitutability of greater amberjack for other species. The total ACL for which the sector ACLs are based upon is derived from Preferred Alternative 2 in Action 1.

Recreational Sector

Alternative 1 (No Action) would maintain the current recreational allocation of 59.34% of the total ACL. **Alternatives 2 and 3 (Preferred)** would result in comparatively higher recreational sector allocations and sector ACLs (70.16% and 65.00% of the total ACL respectively). Most of the recreational ACLs in **Action 2** are estimated to be constraining based the 5-year average annual landings from the 2015/2016 to 2019/2020 fishing years (2,025,789 lbs ww; Table 4.1.2.1) , and it is assumed that the recreational sector could fully harvest its ACL if conditions allowed. There would be higher potential landings of greater amberjack under **Alternative 2** and **Preferred Alternative 3** relative to **Alternative 1 (No Action)**. These relatively increased landings would be expected to comparatively increase total CS for the recreational sector. Conversely, **Alternative 4** and **Alternative 5** would result in comparatively lower recreational sector allocations and sector ACLs (55.00% and 50.00% of the total ACL respectively) and would allow lower potential recreational landings which would comparatively decrease total potential CS for the recreational sector (Table 4.2.2.3). When compared to **Alternative 1 (No Action)**, **Alternative 2** would result in the largest estimated increase in CS of \$233,385 in fishing year 2023/24 and an increase in CS of \$192,670 by fishing year 2026/27, followed by **Preferred Alternative 3** with an estimated increase in CS of \$122,085 in fishing year 2023/24 and an increase in CS of \$100,787 by fishing year 2026/27 (2020 \$). Comparatively, **Alternative 5** would result in the largest estimated decrease in CS of \$201,462 in fishing year 2023/24 and a decrease in CS of \$166,317 by fishing year 2026/27, followed by **Alternative 4** with an estimated decrease in CS of \$93,613 in fishing year 2023/24 and a decrease in CS of \$77,282 by fishing year 2026/27 (2020 \$) (Table 4.2.2.4).

Table 4.2.2.3. Percent difference between the recreational sector ACLs in Action 2 compared to 5-year average landings of greater amberjack from 2015/16-2019/20 fishing years and comparison of sector ACLs.

Fishing Year	Recreational sector ACL (lbs ww)	Percent difference between 5-year average landings and the sector ACL	Difference from Alternative 1 (No Action) (lbs ww)
Alternative 1 (No Action)			
2023/24	1,918,462	-5%	-
2024/25	1,672,201	-17%	-
2025/26	1,601,587	-21%	-
2026/27+	1,583,785	-22%	-
Alternative 2			
2023/24	2,268,273	12%	349,811
2024/25	1,977,109	-2%	304,908
2025/26	1,893,618	-7%	292,031

^aAssumes the total ACL in Preferred Alternative 2 of Action 1 to determine the sector ACL.

Table 4.2.2.4. Estimated change in potential net economic benefits for the recreational sector (CS) from the alternatives in Action 2 compared to Alternative 1 (No Action) (2020 \$).

Fishing Year	Alternative 2	Preferred Alternative 3	Alternative 4	Alternative 5
2023-2024	\$233,385	\$122,085	-\$93,613	-\$201,462
2024-2025	\$203,427	\$106,414	-\$81,596	-\$175,601
2025-2026	\$194,836	\$101,920	-\$78,151	-\$168,186
2026-2027+	\$192,670	\$100,787	-\$77,282	-\$166,317

Assumptions used in calculating these estimates include application of the status quo allocation of the total ACL (40.66% commercial, 59.34% recreational) to the new ACL for each alternative to estimate economic benefits. This allocation is then compared to 5-year average landings (2015/2016-2019/2020) to determine the buffer between average annual landings and the ACL by sector under the assumption that both sectors would fully harvest their respective ACLs. To estimate net economic benefits for the recreational sector, a CS estimate of \$13.11 for a “generic snapper” kept on a recreational trip is used (2020 \$; Section 3.3). This marginal value estimate is used as a proxy value since one is not currently available specifically for greater amberjack. A weight of 19.65 lbs ww per greater amberjack is used to convert the recreational portion of the buffer from lbs ww to numbers of fish (Personal Communication, NOAA Southeast Fisheries Science Center SAFE Dataset, March 17, 2021). It is assumed that changes in the recreational portion of the total ACL would only affect catch per trip and not the overall number of trips taken due to the low bag limit for greater amberjack and a large number of potential substitute target species. Additionally, this consistent with the assumptions made in the analysis provided in Appendix F. This assumption includes no direct change to for-hire fishing activity and thus no change in direct economic effects for the for-hire component of the recreational sector. As such, there are no estimated changes in PS provided for the recreational sector. In comparing alternatives, **Alternative 1 (No Action)** was used as a baseline which applied the current allocation of 59.34% of the total ACL to the recreational sector. The total ACL in this case was based on Preferred Alternative 2 in Action 1 and applied to the alternatives in **Action 2**.

Total

The alternatives in **Action 2** can be ranked for the commercial sector from a short-term economic perspective with **Alternative 5** resulting in the highest potential benefits followed by **Alternative 4**, **Alternative 1 (No Action)**, **Preferred Alternative 3**, and **Alternative 2**. For the recreational sector, the ranking would be the opposite with **Alternative 2** resulting in the highest potential benefits followed by **Preferred Alternative 3**, **Alternative 1 (No Action)**, **Alternative 4**, and **Alternative 5**. In terms of total estimated net economic benefits for the action, the same ranking would apply as stated for the recreational sector. In comparison to **Alternative 1 (No Action)**, **Alternative 2** would increase net economic benefits by \$22,658, **Preferred Alternative 3** would increase net economic benefits by \$11,852, **Alternative 4** would decrease net economic benefits by \$9,088, and **Alternative 5** would decrease net economic benefits by \$19,599 in the 2023/2024 fishing year (Table 4.2.2.5)(2020 \$).

Table 4.2.2.5. Estimated change in potential net economic benefits from the alternatives in Action 2 compared to Alternative 1 (No Action) (2020 \$).

Fishing Year	Alternative 2	Preferred Alternative 3	Alternative 4	Alternative 5
2023-2024	\$22,658	\$11,852	-\$9,088	-\$19,559
2024-2025	\$19,749	\$10,331	-\$7,922	-\$17,048
2025-2026	\$18,915	\$9,894	-\$7,587	-\$16,328
2026-2027+	\$18,705	\$9,785	-\$7,503	-\$16,147

4.2.3. Social Effects

Since sector allocations exist for the recreational and commercial sectors already, **Alternative 1 (No Action)** would maintain the current allocation percentages and may have few social effects as both sectors would see an increase in available poundage. With **Alternative 2** and **Preferred Alternative 3**, there would be a decrease in the commercial percentage compared to **Alternative 1 (No Action)**, which could have some negative social effects if commercial fishermen have a negative perception of this change due to the decrease in fishing opportunity and concerns about long-term social effects, especially if future actions further decreased harvest opportunities. However, the increase in poundage may mitigate some of these concerns and result in positive social benefits associated with increased harvest in the short-term. Alternatively, under **Alternative 4** and **Alternative 5** there would be a decrease in the recreational percentage compared the **Alternative 1 (No Action)** which may result in similar negative social effects for the recreational sector.

Fishing communities in Florida and Georgia consistently experience the highest recreational and commercial landings of greater amberjack, followed by North Carolina and South Carolina. Communities that land a substantial proportion of greater amberjack and are reliant upon commercial and recreational fishing and thus would be most affected by a decrease in allocation percentage under **Alternative 2** and **Preferred Alternative 3** (commercial) and **Alternative 4** and **Alternative 5** (recreational) are discussed in Section 3.4. Ultimately, the **Alternative 2**, **Preferred Alternative 3**, **Alternative 4**, and **Alternative 5** will promote conservation by updating catch levels based on the most recent stock assessment ensuring the resource is well-managed and will remain available to a diverse group of users in order to optimize social benefits.

As mentioned, there can be many different social effects that result as further allocations are discussed, and perceptions are formed. In the past there has been some resistance to further decreasing a given sector’s percentage allocation. It is difficult to predict the social effects with any allocation scheme as it would depend upon other actions in conjunction with this one. A reduction in allocation for one sector may be compounded by a restrictive choice of ABC or ACL (Action 1). Therefore, the choice of an allocation would need to be assessed with other actions within this amendment to determine the overall social effects and whether short-term losses are offset by any long-term biological gains.

Projections for Action 1 – **Preferred Alternative 2** indicate that the commercial ACL for greater amberjack would not be reached under the any of the alternatives proposed in Action 2, apart from a possible closures in Season 1 and Season 2 under the high landings scenario (maximum landings over the last five years and three years, respectively). (Tables 4.2.1.4 and 4.2.1.5). However, the recreational ACL could be reached in fishing year 2026-27 under **Alternative 1 (No Action)**, **Alternative 4**, and **Alternative 5** (Table 4.2.1.7) using the five year average landings. As a result, the recreational sector may experience negative social effects associated with AMs which, when triggered, can restrict harvest in the current season or subsequent seasons (**Section 4.1.3**).

The communities most likely to experience those impacts are those that are highly reliant upon recreational fishing including the Florida Keys, Florida (Islamorada and Tavernier); Hatteras, North Carolina, and Manteo, North Carolina (Figure 3.4.2.1). While none of these communities exceed thresholds related to social vulnerability (Figure 3.4.3.1) that would make them susceptible to negative social effects due to regulatory changes, and individual fishing businesses may experience negative social effects in short-term such as cancelled trips or lower trip satisfaction if anglers are unable to retain fish caught during a closure.

4.2.4. Administrative Effects

Compared to **Alternative 1 (No Action)**, none of the Action 2 alternatives under consideration to modify greater amberjack allocations and sector ACLs would result in significant impacts on the administrative environment. Similar to **Alternative 1 (No Action)**, **Alternatives 2 and 3 (Preferred)**, **4 and 5** are not likely to result in increased staff time, require increased agency funding, or alter the manner in which law enforcement efforts are presently carried out. Other administrative burdens that may result from **Alternatives 2 through 5** would take the form of development and dissemination of outreach and education materials for fishery participants and law enforcement. Overall, because sector allocations and ACLs are currently in place for greater amberjack, the impacts on the administrative environment are expected to be neutral. Additionally, the burden on law enforcement would not change under any of the considered alternatives because quota closures implemented in-season are currently enforced.

4.3. Action 3. Reduce the commercial minimum size limit for greater amberjack

For detailed methodology of the analysis to evaluate the effects of reducing the current commercial minimum size limit of greater amberjack, refer to **Appendix F**.

4.3.1. Biological Effects

Expected effects to greater amberjack

Reducing the current 36-inch FL commercial minimum size limit for greater amberjack as proposed under **Alternative 2, Preferred Alternative 3, and Alternatives 4 and 5** is expected to result in increased commercial landings compared to **Alternative 1 (No Action)**, as a larger amount of smaller fish that would be discarded could be kept (Figure 4.3.1.1).¹⁶ As harvest rates could be expected to increase under a reduced minimum size limit, the commercial fishing season may be shortened under current AMs if the quota is met in-season. However, because commercial harvest is still constrained by the ACL, and AMs are in place to prevent the ACL from being exceeded, any increase in harvest should not result in adverse biological consequences to the stock. Therefore, the biological effects to the stock from **Alternative 2, Preferred Alternative 3, and Alternatives 4 and 5** would be neutral relative to **Alternative 1 (No Action)**.

Alternatives

- 1 (No Action). The current commercial minimum size limit is 36 inches FL.
2. Decrease the commercial minimum size limit to 34 inches FL
- 3. Decrease the commercial minimum size limit to 32 inches FL**
4. Decrease the commercial minimum size limit to 30 inches FL
5. Decrease the commercial minimum size limit to 28 inches FL

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

¹⁶ Harvest datasets were not useful for this analysis since it is illegal to harvest greater amberjack below the minimum size limit, and this results in dockside commercial harvest surveys collecting very little length data for greater amberjack below the minimum size limit. However, observer data has length information for released fish, and observer data were provided from the SEFSC. The commercial observer program started in the South Atlantic region in 2008 with a voluntary program where captains could volunteer to have an observer on their boat. This changed in 2014 where observer coverage was made mandatory. However, the South Atlantic observer data program only sampled a small proportion of the commercial fleet and greater amberjack data are only available for the years of 2018, 2019, and 2020. The commercial observer program produced lengths from 38 released greater amberjack in the South Atlantic region (Figure 4.3.1.1).

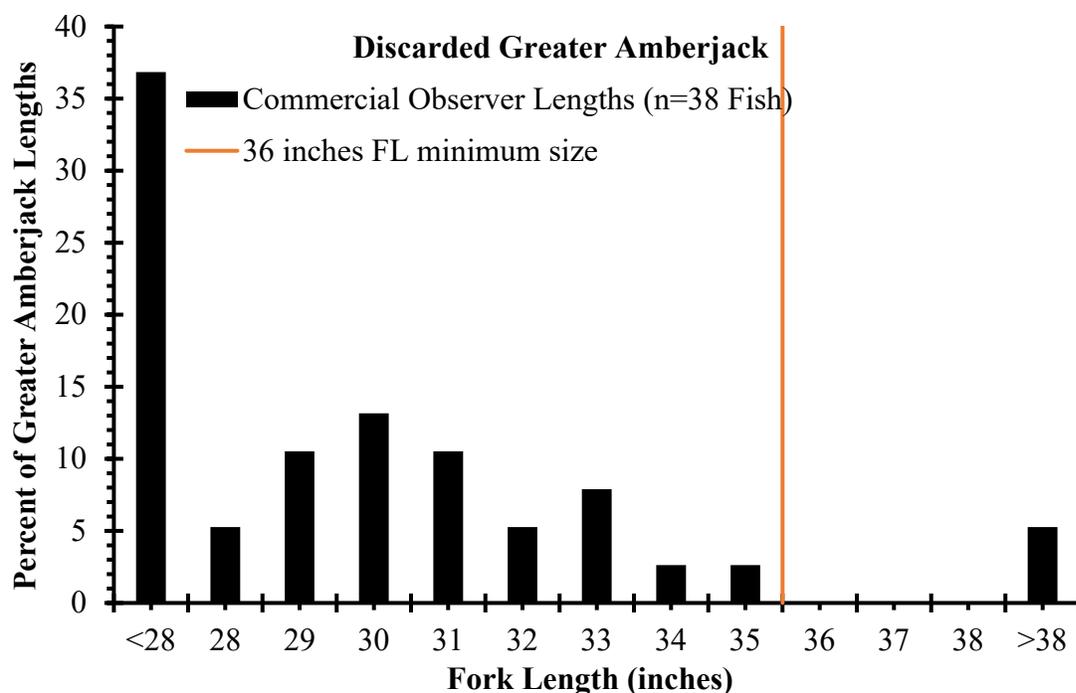

Figure 4.3.1.1. Length distribution of greater amberjack landed from released fish in the commercial sector from 2018 through 2020. The data were plotted in 1-inch length increments, and the length data are in fork length. The data came from the commercial observer program which had limited greater amberjack observer data. The orange line represents the current commercial minimum size limit of 36 inches FL.

Expected Effects to Bycatch and Discards

A low release mortality rate of 20% (sensitivity range: 10-30%) was estimated for greater amberjack in the South Atlantic (SEDAR 15 2008 and SEDAR 59 2020). The regulation ‘not legal size’ was the most common reason selected for released greater amberjack (Vision Blueprint Commercial Regulatory Amendment 27 to the Snapper Grouper FMP, SAMFC 2019). Reducing the current 36-inch FL commercial minimum size limit for greater amberjack under **Alternative 2, Preferred Alternative 3, and Alternatives 4 and 5** would likely reduce discards during the open months compared to **Alternative 1 (No Action)**, which is expected to increase commercial landings as more fish that would be discarded could be kept. Since greater amberjack has a low estimated release mortality, a high percentage of released fish likely survive; therefore, any dead discards are expected to be minimal, potentially resulting in minimal adverse long-term population effects from a decrease in the minimum size limit.

4.3.2. Economic Effects

Reducing the commercial minimum size limit for greater amberjack under **Alternative 2, Preferred Alternative 3, Alternative 4, and Alternative 5** would increase harvest since smaller fish that were previously discarded due to the current 36-inch minimum size limit (**Alternative 1 (No Action)**) could be landed. This would provide positive direct economic effects for the commercial sector provided there are no long-term negative effects for the stock from the increased harvest. In general, the lower the size limit, the more that overall harvest would

increase in the short-term, thereby increasing economic benefits incurred from such harvest. These economic benefits may accrue in the form of increased net revenue for commercial vessels, thus increasing PS for the commercial sector. Under this notion, the highest economic benefits would occur under **Alternative 5**, followed by **Alternative 4**, **Preferred Alternative 3**, **Alternative 2**, and **Alternative 1 (No Action)**. Data are not available that would provide quantitative analysis of this action (Appendix F). Estimates of net revenues or economic profit are not available for snapper grouper dealers. Therefore, it is also not possible to estimate the effect of changes in purchases on their profits. However, in general, dealers are indirectly affected whenever gross revenues to commercial fishing vessels are expected to change (e.g., increases in gross revenues are expected to indirectly benefit dealers and vice versa). Thus, the ranking of economic benefits to dealers would be the same as stated above.

4.3.3. Social Effects

Some social effects of minimum size limits would be associated with the biological effects on greater amberjack (see **Section 4.4.1**). Additionally, there is a trade-off with reducing the minimum size limit in that an increase in the number of fish that can be kept may improve commercial trip profitability but may also increase the harvest rate and trigger AMs if landings reach the ACL sooner in the fishing year.

Available discard data shows that just under 40% of discarded greater amberjack are less than 28-inches FL, with the vast majority being under the current size limit (Figure 4.4.1.1). As such, reducing the minimum size limit (**Alternative 2**, **Preferred Alternative 3**, **Alternative 4**, **Alternative 5**) may result in positive social effects for greater amberjack fishermen by increasing the number of fish that can be retained, which may increase trip profitability. Positive effects of decreasing the minimum size limit would result from reduced discards. This would be expected to reduce waste for this portion of the snapper grouper fishery and may improve perceptions of management performance.

Currently, the minimum size limit for the recreational sector is lower than that for the commercial sector. Creating consistency in regulations between the two sectors (**Alternative 5**) would simplify regulations and may improve enforcement and compliance.

4.3.4. Administrative Effects

Reducing the commercial minimum size limit is expected to allow more fish to be kept, which could increase the chances that an in-season closure could occur which would require in-season notices. Administrative impacts on the agency associated with the action alternatives would be incurred by rulemaking, outreach, education and enforcement. Therefore, although the administrative burden would be negative under each alternative considered if the quota is met and an in-season closure is required, an increase in administrative effects would be expected to be neutral under **Alternatives 2 through 5** compared to **Alternative 1 (No Action)**.

4.4. Action 4. Increase the seasonal commercial trip limits for greater amberjack

For detailed methodology of the analysis to evaluate the effects of increasing the current commercial trip limits of greater amberjack, refer to **Appendix F**. The greater amberjack trip limits may currently be harvested and possessed in either lbs ww or lbs gw. The conversion factor between the two measurements is 1.04. Hence, the discrepancy in specifying the proposed trip limits in whole weight is statistically insignificant and does not change the outcome of analyses presented in this amendment.

4.4.1. Biological Effects

Expected effects to greater amberjack

The biological effects of **Alternatives 2** and **Preferred Alternative 3** and their sub-alternatives would not differ from **Alternative 1 (No Action)** in terms of the risk of overfishing as overall harvest would be limited to the commercial ACL or split-season quotas, and AMs would be triggered if the ACL were reached.

Season 1 landings and predicted closures (Alternative 2 and Sub-Alternatives 2a-2c)

During the first commercial season (Season 1 is from March through August), the majority of commercial trips harvest less than the current trip limit of 1,200 lbs, with very few trips landing more than 1,400 lbs (Figure 4.4.1.1). **Alternative 2** and its sub-alternatives consider increasing the commercial trip limit for Season 1 from the current 1,200 lbs up to 2,500 lbs (**Sub-Alternative 2c**). As harvest rates could be expected to increase under an increased trip limit, the commercial fishing season may be shortened under current AMs if the quota is met in-season. Predicted future landings and potential in-season closure dates for **Alternative 2** and its sub-alternatives are shown in Table 4.4.1.1. The closure dates were generated from the three different landings scenarios¹⁷ of 1) three-year average of the most recent years of complete data, 2) five-year average of the most recent years of complete data, and 3) the maximum landings in the last five years of complete data. With a single exception, closures are only predicted under the maximum landings (scenario 3). Under scenario 3 the future commercial landings are assumed to reflect the maximum landings for a single year in the past 5 years. The predicted in-season closure dates from scenario 3 span from as early as June 14 under **Sub-Alternative 2c** to no in-season closure needed. The Season 1 quota could be reached as early as June 20 under **Sub-Alternative 2b**, June 27 under **Sub-Alternative 2a**, and June 14 under **Sub-Alternative 2c**.

¹⁷ These values can be found in Tables F-10 and F-17 in Appendix F.

Alternatives

1 (No Action). The current Season 1 commercial trip limit for greater amberjack is 1,200 lbs, and the Season 2 commercial trip limit is 1,000 lbs.

2. Increase the Season 1 trip limit for greater amberjack to:

Sub-Alt 2a. 1,500 lbs

Sub-Alt 2b 2,000 lbs

Sub-Alt 2c 2,500 lbs

3. Increase the Season 2 trip limit for greater amberjack to:

Sub-Alt 3a. 1,200 lbs

Sub-Alt 3b: 1,500 lbs

Sub-Alt 3c 2,000 lbs

Sub-Alt 3d 2,500 lbs

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

The most conservative projected landings are under **Alternative 1 (No Action)** in which Season 1 would retain the lowest trip limit at 1,200 lbs, resulting in a possible in-season closure by July 1. However, because commercial harvest is still constrained by the ACL, and AMs are in place to prevent the ACL from being exceeded, any increase in harvest should not result in adverse biological consequences to the stock. Therefore, the biological effects to the stock from **Alternative 2** and its sub-alternatives would be neutral relative to **Alternative 1 (No Action)**.

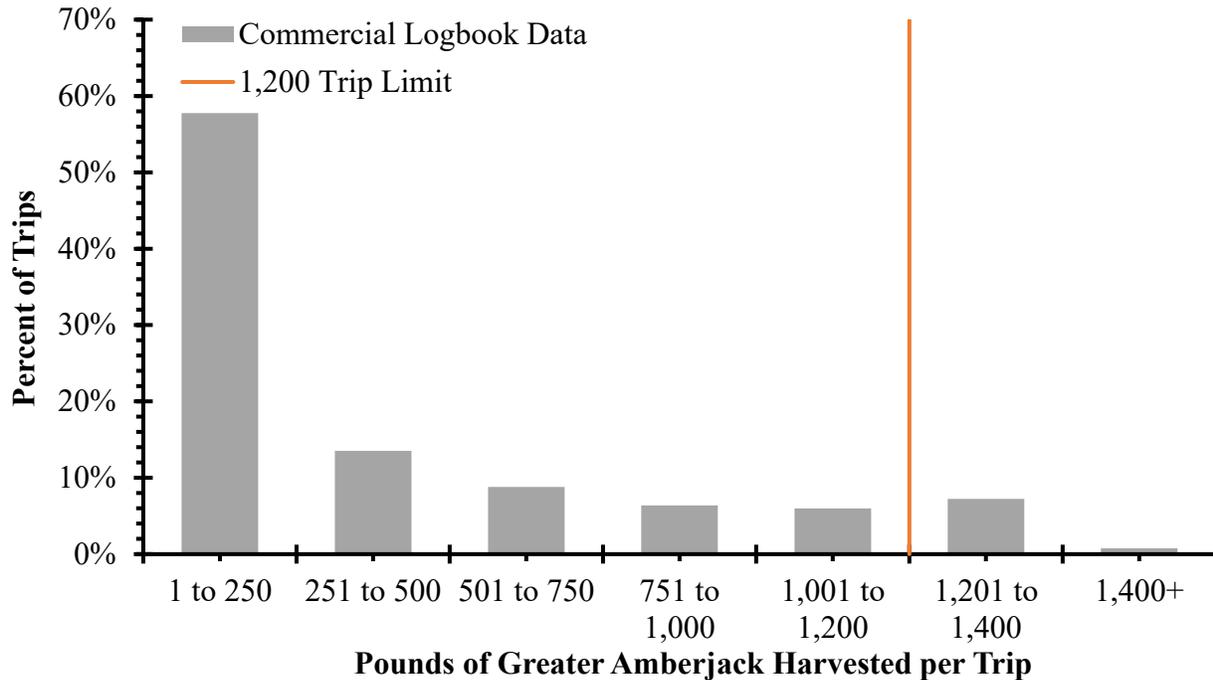

Figure 4.4.1.1. Distribution of the South Atlantic greater amberjack commercially harvested per trip (lbs ww) for season 1. Season 1 is from March 1 through August 31. Data comes from the commercial logbook dataset from 2016 to 2020 (n = 7,720 trips), and the weight unit is in lbs ww. The orange line represents the current commercial trip limit of 1,200 lbs ww.

Table 4.5.1.1. The projected closure dates for the greater amberjack commercial sector Season 1 from increasing the trip limit.

Alternative	Year	Commercial ACL Season 1 (lbs gw)	Scenario 1 Closure Date	Scenario 2 Closure Date	Scenario 3 Closure Date
1 (No Action) (1,200 lbs)	2022/2023	884,423	None	None	None
	2024/2025	569,019	None	None	12-Jul
	2026/2027	538,933	None	None	1-Jul
2a (1,500 lbs)	2022/2023	884,423	None	None	None
	2024/2025	569,019	None	None	5-Jul
	2026/2027	538,933	None	None	27-Jun
2b (2,000 lbs)	2022/2023	884,423	None	None	None
	2024/2025	569,019	None	None	27-Jun
	2026/2027	538,933	None	None	20-Jun
2c (2,500 lbs)	2022/2023	884,423	None	None	None
	2024/2025	569,019	None	None	21-Jun
	2026/2027	538,933	None	30-Aug	14-Jun

*Commercial ACLs (lbs ww) for greater amberjack are based on the revised total ACL from Preferred Alternative 2 in Action 1, and Alternative 3 in Action 2.

**Data years used for Scenarios 1-3 can be found in Section F-2 in Appendix F.

Season 2 landings and predicted closures (Alternative 3 and Sub-Alternatives 3a-3d)

During Season 2 (September through the end of February), the majority of commercial trips harvest less than the current trip limit of 1,000 lbs, with less than 10% trips landing more than 1,000 to 1,200 lbs (Figure 4.5.1.2). **Preferred Alternative 3** and its sub-alternatives consider increasing the commercial trip limit for Season 2 from the current 1,000 lbs up to 2,500 lbs (**Sub-Alternative 3d**). As harvest rates could be expected to increase under an increased trip limit, the commercial fishing season may be shortened under current AMs if the quota is met in-season. A prediction of future landings and potential in-season closure dates are shown in Table 4.4.1.2. For all Alternative 3 sub-alternatives, the predicted in-season closure dates span from as early as January 10 to no in-season closure needed. The Season 2 quota could be reached as early as January 10 under **Sub-Alternative 3d**, February 4 under **Sub-Alternative 3c**, February 4 under **Sub-Alternative 3b**, and no in-season closures expected under **Preferred Sub-Alternative 3a**. The most conservative projected landings are under **Alternative 1 (No Action)** in which Season 2 would retain the lowest trip limit at 1,000 lbs, resulting in no expected closures. However, because commercial harvest is still constrained by the ACL, and AMs are in place to prevent the ACL from being exceeded, any increase in harvest should not result in adverse biological consequences to the stock. Therefore, the biological effects to the stock from **Preferred Alternatives 3** and its **sub-alternatives** would be neutral relative to **Alternative 1 (No Action)**.

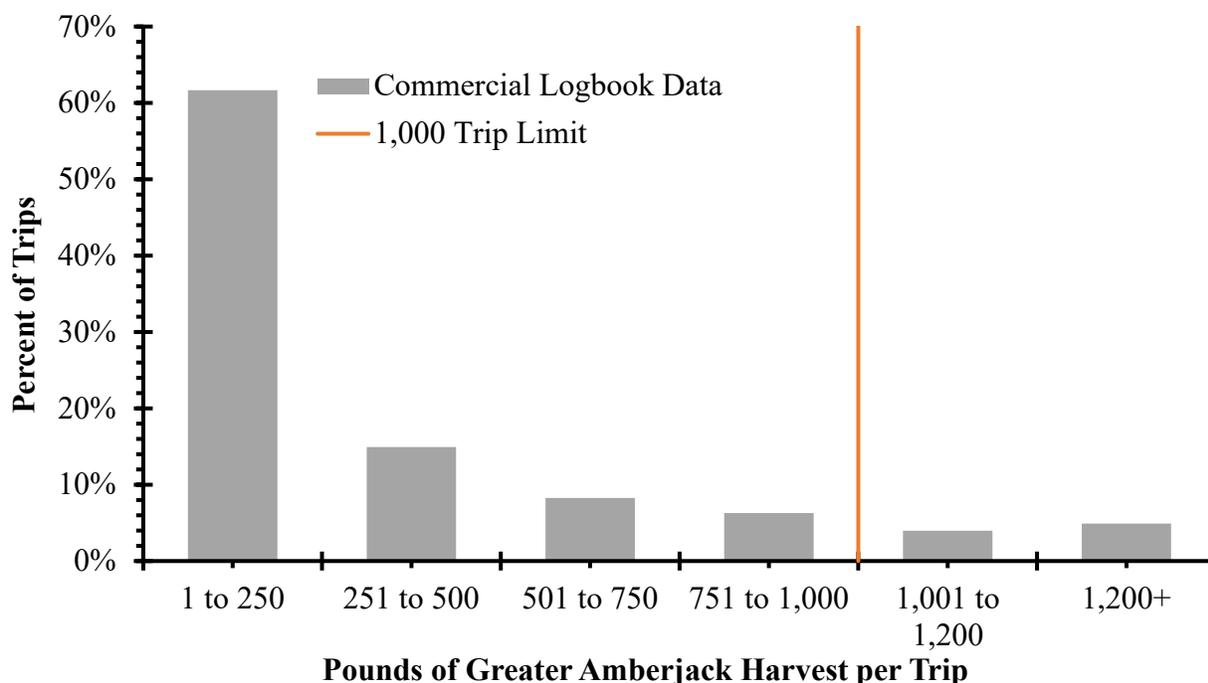

Figure 4.4.1.2. Distribution of the South Atlantic greater amberjack commercially harvested per trip (lbs ww) for Season 2. Season 2 is from September 1 through February 28. Data come from the commercial logbook dataset from 2016 to 2020 (n = 3,075 trips), and the weight unit is lbs ww. The orange line represents the current commercial trip limit of 1,000 lbs ww.

Table 4.4.1.2. The projected closure dates for the greater amberjack commercial sector Season 2 from increasing the trip limit.

Alternatives	Year	Commercial ACL Season 2 (lbs gw)	Scenario 1	Scenario 2
			Closure Date	Closure Date
1 (No Action) (1,000 lbs)	2022/2023	589,615	None	None
	2024/2025	379,346	None	None
	2026/2027	359,288	None	None
3a (1,200 lbs)	2022/2023	589,615	None	None
	2024/2025	379,346	None	None
	2026/2027	359,288	None	None
3b (1,500 lbs)	2022/2023	589,615	None	None
	2024/2025	379,346	None	24-Feb
	2026/2027	359,288	None	11-Feb
3c (2,000 lbs)	2022/2023	589,615	None	None
	2024/2025	379,346	None	4-Feb
	2026/2027	359,288	None	24-Feb
3d (2,500 lbs)	2022/2023	589,615	None	None
	2024/2025	379,346	None	20-Jan
	2026/2027	359,288	None	10-Jan

*Commercial ACLs (lbs ww) for greater amberjack are based on the revised total ACL from Preferred Alternative 2 in Action 1, and Preferred Alternative 3 in Action 2.

**Data years used for Scenarios 1-2 can be found in Section F-2 in Appendix F.

Expected Effects to Bycatch and Discards

Commercial discards of greater amberjack from 2014 through 2016 were low relative to landings (**Appendix F**) and compared to discards of other snapper grouper species, indicating that fishers are likely better able to selectively harvest greater amberjack. In addition to the low release mortality rate of 20% estimated for greater amberjack in the South Atlantic (SEDAR 15 2008 and SEDAR 59 2020), increasing the Season 1 and/or Season 2 commercial trip limit under **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives could result in fewer discards of greater amberjack compared to **Alternative 1 (No Action)** because more fish can be kept, which is beneficial to the greater amberjack stock.

4.4.2. Economic Effects

Generally, commercial trip limits are not considered to be economically efficient because they require an increase in the number of trips and associated trip costs to land the same amount of fish. However, the negative economic effects of this inefficiency can be offset by price support resulting from the supply limitations and the lengthening of seasons. Given the ACL for greater amberjack that restricts maximum harvest to sustainable levels, the alternative with the fewest number of trips that have to stop retaining greater amberjack because the trip limit has been reached would result in the least amount of direct negative economic effects.

Increasing trip limits would allow for increased revenue on trips that land greater amberjack, thereby resulting in an increase in economic benefits to commercial vessels participating in the fishery through increased revenue. Higher trip limits would allow for higher levels of revenue in fewer trips, thus potentially increasing net economic benefits through increased net revenue. For comparison purposes, the increase in the trip limit by sub-alternative compared to **Alternative 1 (No Action)** is provided in Table 4.4.2.1.

Table 4.4.2.1. Marginal Increase in commercial trip limits for the sub-alternatives in Action 4 compared to Alternative 1 (No Action).

Alternative	Difference from Alternative 1 (No Action)(lbs gw)
Sub-Alternative 2a	300
Sub-Alternative 2b	800
Sub-Alternative 2c	1300
Preferred Sub-Alternative 3a	200
Sub-Alternative 3b	500
Sub-Alternative 3c	1000
Sub-Alternative 3d	1500

The quantitative economic effects of this action are largely captured in the economic effects described in Action 1 and Action 2 for the commercial sector, since increased trip limits would

allow for the commercial sector to better utilize the increase in the sector ACL. Thus, the quantitative effects in Table 4.4.2.2 are not necessarily additive to the effects shown in Action 1 and 2, but rather show the estimated economic effects of **Action 4** with all other conditions remaining the same. The estimated change in landings are based on 5-year average commercial landings of 749,344 lbs gw (Table 4.2.1.3) paired with Tables 2 and 4 in the commercial analyses of Appendix F that show the expected percent increase in commercial landings under the various trip limit scenarios. The estimated change in landings is paired with the appropriate price (\$1.79/lbs gw; Tables 3.3.1 and 3.3.2) along with a scaling factor of 35% of gross revenue (Section 3.3.1.2; NMFS SEFSC, pers. comm. 2022) to estimate PS for the commercial sector. **Preferred Sub-Alternative 3a** is estimated to increase net economic benefits by \$28,806 (2020 \$).

Table 4.4.2.2. Comparison of the estimated change in commercial landings of greater amberjack and associated producer surplus (PS) for Action 4 (2020 \$).

Alternative	Estimated change in landings (lbs gw)	Estimated change in PS (2020 \$)
Alternative 1 (No Action)	0	\$0
Sub-Alternative 2a	27,276	\$17,088
Sub-Alternative 2b	71,697	\$44,918
Sub-Alternative 2c	116,118	\$72,748
Preferred Sub-Alternative 3a	45,980	\$28,806
Sub-Alternative 3b	95,856	\$60,054
Sub-Alternative 3c	171,450	\$107,413
Sub-Alternative 3d	247,823	\$155,261

Higher trip limits could also likely result in the commercial AMs being triggered sooner, thus creating an earlier commercial harvest closure for the species. Conversely, lower trip limits, such as **Alternative 1 (No Action)**, would allow for some level of commercial greater amberjack harvest over a longer period but contribute less to net operating revenue on trips where greater amberjack are landed. Lower trip limits may also restrict the ability of the sector to fully harvest its sector ACL, which in this case would be increasing through Actions 1 and 2 in this amendment. In terms of potential net economic benefits **Sub-Alternative 3d**, followed by **Sub-Alternative 3c**, **Sub-Alternative 2c**, **Sub-Alternative 3b**, **Sub-Alternative 2b**, **Preferred Sub-Alternative 3a**, **Sub-Alternative 2a**, and **Alternative 1 (No Action)**. Estimates of net revenues or economic profit are not available for snapper grouper dealers. Therefore, it is not possible to estimate the effect of changes in purchases on their profits. However, in general, dealers are indirectly affected whenever gross revenues to commercial fishing vessels are expected to change (e.g., increases in gross revenues are expected to indirectly benefit dealers and vice versa). Thus, the ranking of economic benefits to dealers would be the same as stated above.

4.4.3. Social Effects

Alternative 2 and **Preferred Alternative 3** propose higher commercial trip limits during season one and season two, respectively, for greater amberjack and would be expected to directly

benefit fishermen operating in the EEZ by allowing for larger landings and thereby increasing trip efficiency when compared to **Alternative 1 (No Action)**.

In general, the potential social effects of a higher trip limit would depend on how fishermen are affected by either a higher trip limit and shorter season, or a lower trip limit and longer seasons, which is likely to vary by individual fishing business. The increased trip limit proposed is anticipated to result in direct social benefits to commercial fishing business in the form of increased trip efficiency and indirect social benefits to fishing communities in the form of increased job opportunities and fish available to the market. The social benefits from the proposed increase in commercial trip limit are likely to be highest in communities that already land a high proportion of greater amberjack, such as Port Orange, Cocoa, and Mayport, Florida; Little River, South Carolina; and Supply, North Carolina (Figure 3.4.1.1).

Projections indicate that the commercial ACLs for greater amberjack (Action 2) would not be reached under the any of the alternatives proposed in Action 2, and the status quo trip limit in **Alternative 1 (No Action)**, apart from a possible closure during the 2026/2027 season (Table 4.2.1.3). If the higher commercial trip limit for greater amberjack increases overall landings, it is possible the commercial ACL could be reached, triggering AMs and resulting in an early closure and associated negative social effects resulting from decreased fishing opportunities. However, none of the trip limits proposed in **Sub-alternative 2a**, **Sub-alternative 2b**, or **Sub-alternative 2c**, are anticipated to result in a closure, except when using the maximum landings over the last five years (Scenario 3) (Table 4.5.1.1). Similarly, for season two, neither **Preferred Sub-alternative 3a**, **Sub-alternative 3b**, **Sub-alternative 3c**, or **Sub-alternative 3d** are anticipated to result in a closure, except when using the maximum landings over the last five years (Scenario 3) (Table 4.5.1.2).

4.4.4. Administrative Effects

Alternative 1 (No Action) would not change the administrative environment from its current condition. Currently, there is a commercial quota monitoring system in place for greater amberjack that is utilized to monitor landings. If the quota for each season is reached prior to the end of the fishing year, NMFS prepares and issues closure notices and enforcement personnel monitors the closures. Since the 2015-2016 fishing year, commercial harvest has experienced an in-season closure three consecutive years due to the quota being reached. Under increased trip limits with **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives, the quota may be met faster than under **Alternative 1 (No Action)** and an in-season closure notice would be required. The likelihood that a quota closure would occur is higher with higher commercial trip limits. However, with an in-season quota closure, there is also potential that the landings would not reach 100% of the ACL. In that circumstance, guidance from the Council to NMFS has recommended that harvest for a snapper grouper species should reopen if landings are less than 95% of the ACL, and the projected number of days to meet the ACL is two or more days¹⁸. Therefore, NMFS would have to monitor the landings and prepare a reopen notice.

¹⁸See the Council's March 6-10, 2017, Summary of Approved Council Motions.

DRAFT DOCUMENT

Since the yearly quota is currently allocated into two fishing seasons under **Alternative 1 (No Action)**, there is potential that fishery managers may have to prepare four in-season notices (i.e., closure notice and reopening notice if it is subsequently determined that a portion of the ACL was not harvested for each of two seasons). Additionally, enforcement personnel would be burdened with potential harvest closures, which they would have to monitor. Outreach materials for each in-season action would take the form of fishery bulletins and updates to NMFS Southeast Regional Office's web site. Similarly, **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives could potentially require four in-season notices. Therefore, although the administrative burden would be negative under each alternative considered if the quota is met and an in-season closure is required, an increase in administrative effects would be expected to be neutral under **Alternative 2** and **Preferred Alternative 3** and their sub-alternatives compared to **Alternative 1 (No Action)**.

4.5. Action 5. Revise the April spawning closure for greater amberjack

For detailed methodology of the analysis to evaluate the effects of revising the April spawning closure greater amberjack, refer to **Appendix F**.

4.5.1. Biological Effects

Expected effects to greater amberjack

Alternative 1 (No Action) offers some protection to spawning fish during April by currently limiting possession to only one fish per person per day or per trip and prohibiting the sale or purchase, which may have positive biological effects on the stock. **Preferred Alternative 2** and **Alternative 3** consider revising the April spawning closure which takes place during the first commercial season (Season 1).

Preferred Alternative 2 would also result in additional, and positive, indirect biological effects if greater harvest restrictions are applied during the peak

spawning month of April. Although regulatory discarding may slightly increase since a bag limit is not allowed and fish would need to be discarded rather than kept, greater amberjack have a low release mortality rate of 20% and the effects to the stock should be minimal. **Alternative 3** would have direct negative effects on the stock by removing the spawning closure during a peak spawning month for this species. Therefore, while both **Alternative 1 (No Action)** and **Preferred Alternative 2** would offer some protection to the stock, overall, **Preferred Alternative 2** would indirectly provide the greatest biological benefits compared to **Alternative 1 (No Action)** in that it encompasses stricter management measures for both sectors during spawning season. Whereas removing the spawning closure, as proposed under **Alternative 3**, could have negative biological effects relative to **Alternative 1 (No Action)** and **Preferred Alternative 2** since harvest would be allowed during the peak spawning month.

Since the commercial sector has, in effect, been closed in the month of April for more than twenty years (SAFMC 1991) predicted April landings were obtained by taking the average of the landings from the two closest months to April (March and May) from 2016 to 2020 (Figure 4.5.1.1 and Appendix F). A prediction of future landings and potential in-season closure dates are shown in Table 4.5.1.1. Under **Alternative 3**, if the April spawning closure were removed altogether and regular commercial harvest were allowed under the current Season 1 trip limit of 1,200 lbs (Section 4.4), the predicted in-season closure dates span from as early as May 22 to no in-season closure needed.

Alternatives

1. (No Action). During April each year, no person may sell or purchase a greater amberjack harvested from the South Atlantic EEZ and the harvest and possession limit is one per person per day or one per person per trip, whichever is more restrictive.

2. Specify during April each year, no person may sell or purchase, harvest or possess a greater amberjack from the South Atlantic EEZ and the harvest and possession limit is zero.

3. Remove the April spawning closure for greater amberjack. Allow purchase, harvest, and possession of greater amberjack from the South Atlantic EEZ according to regulations specified for the rest of the year.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

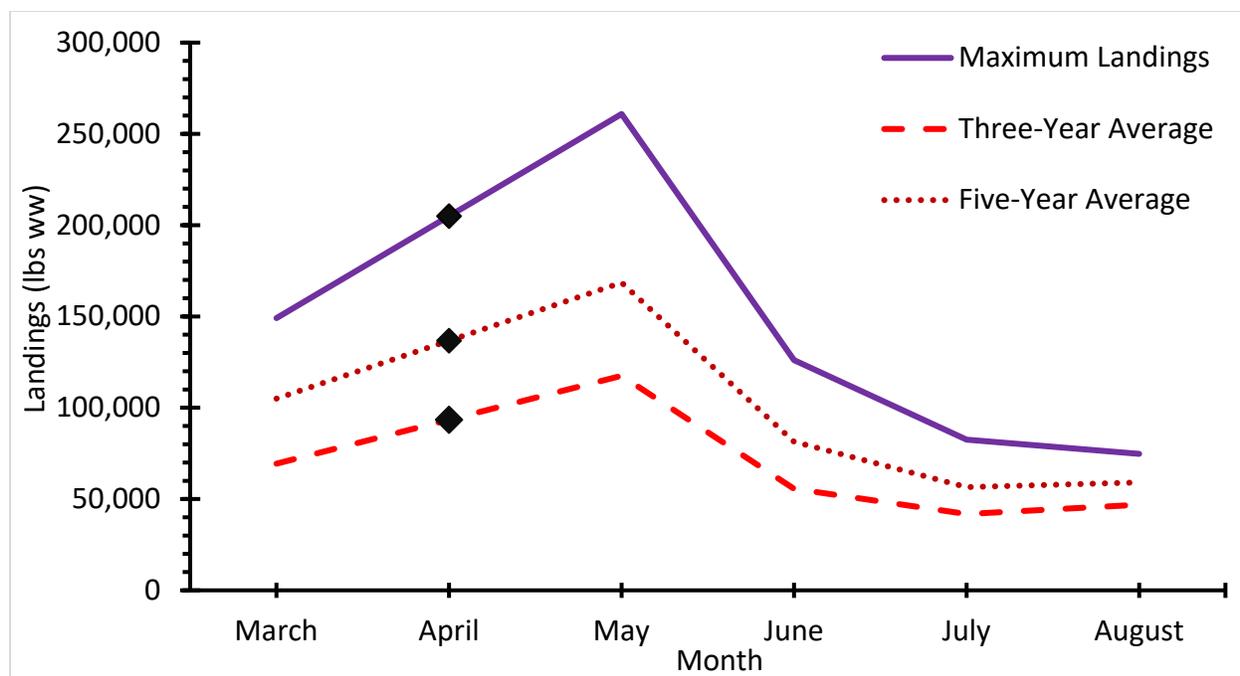

Figure 4.5.1.1. South Atlantic greater amberjack commercial landings in lbs ww by month for Season 1 from 2016 to 2020, three-year average, and five-year average with predicted April landings. Predicted April landings are represented with a black diamond.

Table 4.5.1.1. The projected closure dates for the greater amberjack commercial sector season 1 if the commercial sector was open to commercial harvest in April.

Year	Commercial ACL Season 1 (lbs gw)	Scenario 1	Scenario 2	Scenario 3
2022/2023	884,423	None	None	26-Aug
2024/2025	569,019	None	11-Aug	26-May
2026/2027	538,933	None	26-Jul	22-May

*Commercial ACLs (lbs gw) for greater amberjack are based on the revised total ACL from Preferred Alternative 2 in Action 1, and Preferred Alternative 3 in Action 2.

Expected Effects to Bycatch and Discards

Commercial discards of greater amberjack from 2014 through 2016 were low relative to landings (**Appendix F**) and compared to discards of other snapper grouper species, indicating that fishers are likely better able to selectively harvest greater amberjack. Greater amberjack have a low release mortality rate of 20% estimated in the South Atlantic (SEDAR 15 2008 and SEDAR 59 2020). In addition, removing the April spawning season closure under **Alternative 3** compared to **Alternative 1 (No Action)** and **Preferred Alternative 2**, some of the fish that would result in dead discards could be kept, which could result in beneficial impacts to the greater amberjack stock.

4.5.2. Economic Effects

In general, providing increased protection for spawning greater amberjack would be expected to result in improvements in stock abundance and biomass and create indirect, long-term, positive economic effects presumably through the availability of increased numbers of fish in the future. However, there can be some direct, short-term negative economic effects as fewer fish could be available to harvest until the biomass of harvestable fish increases due to the decrease in the amount of time the species is open to harvest.

Implementing a spawning season closure and harvest prohibition for the recreational sector would be expected to reduce landings of greater amberjack in the short-term and, consequently, CS as well under **Preferred Alternative 2** in comparison to **Alternative 1 (No Action)**. Removing the April spawning season closure to allow for commercial quantities of greater amberjack to be harvested and sold under **Alternative 3** would be expected to increase commercial landings and net operating revenue, as measured in PS. From a short-term economic benefits perspective, **Alternative 3** would provide the highest economic benefits followed by **Alternative 1 (No Action)** and **Preferred Alternative 2**.

The quantitative economic effects of this action may be at least partially captured in the economic effects described in Action 1 and Action 2 for the commercial and recreational sectors, since allowing harvest in April would allow for the commercial sector to better utilize the increase in the sector ACL and prohibiting harvest for the recreational sector would contribute to the reduction in landings that would need to occur. Thus, the quantitative effects in Table 4.5.2.1 are not necessarily additive to the effects shown in Action 1 and 2, but rather show the estimated economic effects of **Action 5**, all other conditions remaining the same. To estimate the change in net economic benefits for the recreational sector (**Preferred Alternative 2**), the estimated change in landings is based on 5-year average recreational landings from the predicted landings for April in Table 6 of the recreational analysis in Appendix F that shows the expected decrease recreational landings from **Action 5** under various landings scenarios. A CS estimate of \$13.11 for a “generic snapper” kept on a recreational trip is used (2020 \$; Section 3.3) and applied to the landings reduction estimate. This marginal value estimate is used as a proxy value since one is not currently available specifically for greater amberjack. A weight of 19.65 lbs ww per greater amberjack is used to convert recreational lbs ww to numbers of fish (Personal Communication, NOAA Southeast Fisheries Science Center SAFE Dataset, March 17, 2021). To convert whole weight to gutted weight, a conversion factor of 1.04 is used. For the commercial sector (**Alternative 3**), the estimated change in landings are based on 5-year average commercial landings from the predicted landings for April in Table 4 of the commercial analysis in Appendix F that shows the expected increase commercial landings under various landings scenarios. The estimated change in landings is paired with the appropriate price (\$1.79/lbs gw; Tables 3.3.1 and 3.3.2) along with a scaling factor of 35% of gross revenue (Section 3.3.1.2; NMFS SEFSC, pers. comm. 2022) to estimate PS for the commercial sector. **Preferred Alternative 2** is estimated to decrease net economic benefits by \$69,981 (2020 \$).

Table 4.5.2.1. Comparison of the estimated change in landings and economic benefits associated with Action 5.

Alternative	Estimated change in landings (lbs gw)	Estimated change in net economic benefits (2020 \$)
Alternative 1 (No Action)	0	\$0
Preferred Alternative 2	-100,858	-\$69,981
Alternative 3	136,748	\$85,673

4.5.3. Social Effects

The potential effects on coastal communities of modifying the greater amberjack spawning season closure sale and harvest limits would be a trade-off between the biological benefits of reduced harvest during the spawning season and resulting long term social benefits from a healthier stock and the social benefits of year-round access to fishing opportunities for greater amberjack improving trip profitability and fish available on the market. In general, more restrictive management during spawning seasons may be biologically beneficial to the stock and contribute to sustainable fishing opportunities in the future. Communities that are likely to experience these short-term versus long-term benefits are discussed in Section 3.4 and a primarily located along the Florida coast.

Allowing commercial harvest during the spawning season may also increase the harvest rate and trigger AMs if landings reach the ACL sooner in the fishing year. Under **Alternative 3**, the only alternative that would allow commercial harvest of amberjack during the month of April (season one) may not experience any closure or may close as early as May 22nd.

Assuming that closing harvest during spawning ensures sustainable harvest of greater amberjack, as envisioned, long-term benefits to fishing communities in the form of consistent access to the resource would be highest under **Preferred Alternative 2**, followed by **Alternative 1 (No Action)**, and **Alternative 3**. Alternatively, short-term negative effects on fishing communities due to restrictions in fishing opportunities would be lowest under **Alternative 3** followed by **Alternative 1 (No Action)**, and **Preferred Alternative 2**.

4.5.4. Administrative Effects

Administrative effects would not vary greatly between **Alternative 1 (No Action)** and **Preferred Alternative 2**. Currently, both the commercial and recreational sectors for greater amberjack may only harvest and possess the recreational bag limit during April each year, which is already being monitored for enforcement and compliance. Bag limit regulations under **Alternative 3** would vary between the sectors during the month of April; therefore, beneficial administrative effects would be expected from **Alternative 1 (No Action)** and **Preferred Alternative 2**, when compared with **Alternative 3**. Alternatives that specify consistent regulations in federal waters throughout the Council’s jurisdiction would contribute to a more favorable administrative environment by helping the public avoid confusion with regulations and aid law enforcement. Administrative impacts on the agency associated with the action alternatives would be incurred by rulemaking, outreach, education and enforcement.

4.6. Action 6. Remove recreational annual catch targets from the Snapper Grouper Fishery Management Plan

4.6.1. Biological Effects

Expected Effects to Snapper Grouper Species

Management controls, such as AMs, are put in place to prevent ACLs from being exceeded, and to correct or mitigate overages of the ACL if they occur. As explained in **Sections 1.4** and **2.6**, recreational ACTs can also be used to prevent ACLs from being exceeded if management measures are tied to those target levels. In managing the snapper grouper fishery, however, the Council is considering

removing the recreational ACTs from the Snapper Grouper FMP in this amendment because the Council has not used the ACT to manage the snapper grouper fishery and therefore, these targets are not used in regulations. However, the Council has accounted for any management uncertainty when setting the ACL. Since the recreational ACT is meant to be set lower than the ACL (and would therefore be reached sooner), using a recreational ACT rather than the ACL as a trigger for AMs in the recreational sector may reduce the incidence of ACL overages and the need to compensate for them. This more conservative approach would likely help to ensure that recreational data uncertainties do not cause or contribute to excessive ACL overages for vulnerable species. Therefore, retaining recreational ACTs under **Alternative 1 (No Action)** could have beneficial effects to snapper grouper species but only if a management measure, such as an AM or a bag limit reduction, was triggered when landings reach the target. Because the Council has not employed recreational ACTs in its management strategy for the snapper grouper fishery, the biological effects of **Preferred Alternative 2** would be neutral compared to **Alternative 1 (No Action)**.

Expected Effects to Bycatch and Discards

This action would not be expected to affect discards and/or bycatch, since the only consequence of reaching the ACT would be to continue to monitor the landings, which MRIP does continually. For more information on bycatch and discards, see **Appendix G (BPA)**.

4.6.2. Economic Effects

The purpose of ACTs is to help prevent a sector from exceeding its ACL due to management uncertainty. Exceeding an ACL would have direct negative economic effects on all sectors potentially due to a reduced stock size. If a species were closed too early for a sector based on the ACT, there would be direct negative economic effects as well because the sector was prohibited from harvesting fish. The ACTs covered by this action only apply to the recreational sector and are not currently tied to any management measure such as AMs; therefore, there are

Alternatives

1 (No Action). Retain current recreational ACTs for species managed under the Snapper Grouper FMP.

2. Remove current recreational ACTs for species managed under the Snapper Grouper FMP.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

no expected economic effects associated with their removal. From a comparison of economic benefits perspective, **Preferred Alternative 2** would be neutral compared to **Alternative 1 (No Action)**.

4.6.3. Social Effects

If tied to management action such as AMs, ACTs would result in negative social impacts in the short term because these would be linked to reduced economic benefits and reduced fishing opportunities. Reductions in harvest thresholds may have potential negative social effects, which can range from changes in fishing behavior to other social disruptions that go beyond impacts to the fishery and may extend to the community or region. However, there would be long-term social benefits for fishermen, communities, and the public by preventing overfishing through an ACT for a stock that has potential to exceed the ACL. Those benefits would include more fishing opportunities and increased income, which should benefit the coastal economy and contribute to community resilience for those involved in these fisheries.

However, as stated in **Section 4.6.1**, recreational ACTs are currently not an active part of the management strategy for snapper grouper species and AMs are in place to ensure that ACLs are not exceeded. Therefore, the social effects of **Preferred Alternative 2** would be neutral compared to **Alternative 1 (No Action)**.

4.6.4. Administrative Effects

Under this action, it is important to note that recreational data collection can be more administratively burdensome due to time delays and lengthy reviews. Specifying a recreational ACT alone would not increase the administrative burden over the status quo, other than adding an additional layer of precautionary monitoring to the system of AMs. In-season monitoring needed for tracking how much of the recreational ACT has been harvested throughout a particular fishing season can potentially result in a need for additional cost and personnel resources if a monitoring mechanism is not already in place. However, because the recreational ACT alternatives as they are presented here do not trigger any corrective or preventative action, no additional in-season monitoring is required regardless of where the recreational ACT level is set. Therefore, administrative burden is expected to be reduced in a small amount under **Preferred Alternative 2**, compared to **Alternative 1 (No Action)**.

Chapter 5. DRAFT Council’s Choice for the Preferred Alternative

5.1. Action 1. Revise the greater amberjack overfishing limit, acceptable biological catch, total annual catch limit and annual optimum yield

5.1.1. Snapper Grouper Advisory Panel Comments and Recommendations

The South Atlantic Fishery Management Council’s (Council) Snapper Grouper Advisory Panel (AP) discussed Amendment 49 via webinar on April 21-23, 2021, and in-person on April 18-20, 2022. The Snapper Grouper AP also received an update on development of the amendment during their October 19-21, 2021, webinar meeting and had no additional comments at that time.

In April 2021, the Snapper Grouper AP provided the following comments and recommendations on the total annual catch limit:

- For Action 1 (Total Annual Catch Limit (ACL) and Optimum Yield (OY)), rather than the Preferred Alternative that results in a large, short-term increase to the ACL, the Snapper Grouper AP recommends a more conservative approach that benefits both sectors and consideration of a consistent ACL. The Snapper Grouper AP also recommends the Council consider the potential economic implications of large, sudden changes in the ACL.
- The Snapper Grouper AP also discussed a consistent/constant ACL that is the same throughout the projection period and does not result in a large, immediate upswing. Use a number approximately in the middle, so that the “surplus” is not completely used up in a short timeframe.
- Consider the potential of increased pressure on greater amberjack as other harvest for other species become more restricted.
- Consider economic implications of a large increase to the recreational ACL possibly resulting in an influx of new entrants into the fishery, followed by reductions to the ACL over time and limiting use of the resource to the recent entrants.
- There is not a huge public demand for greater amberjack, so no need for very large increase to the commercial ACL (i.e., the supply). This could negatively impact the price, which currently is pretty good.
- Greater amberjack are a redirected target for the Florida charter component when they are not able to target dolphin.

Alternatives

1. (No Action). Maintain current OFL. The total ACL for greater amberjack is equal to the current ABC.

2. Revise the OFL and ABC. The total ACL for greater amberjack is equal to the SSC recommended ABC.

3. Revise the OFL and ABC. The total ACL for greater amberjack is equal to 90% of the SSC recommended ABC.

4. Revise the OFL and ABC. The total ACL for greater amberjack is equal to 80% of the SSC recommended ABC.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

DRAFT DOCUMENT

MOTION: RECOMMEND THE COUNCIL CONSIDER AN ADDITIONAL ACTION 1 ALTERNATIVE OF A CONSISTENT 2.8 MILLION POUND TOTAL ACL AND A PREFERRED ALTERNATIVE OF ACTION 2-ALTERNATIVE 1 (MAINTAIN CURRENT SECTOR ALLOCATIONS).
APPROVED BY AP

The Council added and later removed an alternative for Action 1 that would set harvest at 2,818,000 pounds for the first three years of new management before setting the ACL equal to the acceptable biological catch (ABC) (see [Appendix E](#)).

In April 2022, the Snapper Grouper AP provided the following comments and recommendations:

- In general, there were concerns over the health of the greater amberjack stock. It was noted that:
 - Greater amberjack may be in similar situation to gag or snowy in that they appear to be declining; may be better to be more conservative now (North Carolina).
 - Not seeing as many greater amberjack in recent years (North Carolina; Cape Canaveral and Stuart, Florida).
 - The fishery has not been catching ACL as it currently stands.

MOTION: RECOMMEND THE FOLLOWING TO THE COUNCIL:

1. TOTAL ACL EQUALS THE 2026/2027+ ABC (2,669,000 LBS)
[Additional components of this motion are listed with their respective actions]
- APPROVED BY AP

Rationale for motion: Compromise and working together between sectors and regions for most equitable fishery possible and retaining sustainability in the amberjack fishery. General consensus that the AP does not feel the stock is as healthy as suggested by the assessment.

5.1.2. Law Enforcement Advisory Panel Comments and Recommendations

The Law Enforcement AP convened in Charleston, South Carolina, on February 10, 2022. The Law Enforcement AP received a briefing on the amendment and had no comments or recommendations.

5.1.3. Scientific and Statistical Committee (SSC) Comments and Recommendations

The SSC convened in Charleston, South Carolina, on February 26-28, 2022. The SSC received a briefing on the amendment and had no comments or recommendations.

5.1.4. Public Comments and Recommendations

Scoping hearings were held via webinar on April 14 and 15, 2021. Four written comments were submitted online, and those can be viewed [HERE](#). Nine members of the public attended scoping hearings, though not all attendees provided verbal comments. During scoping:

DRAFT DOCUMENT

- All comments received supported **Alternative 2**.

Public comments also were solicited from May 27, 2022, through June 17, 2022, in conjunction with the Council's June 2022 meeting. Seven written comments were submitted online during this comment period, and those can be viewed [HERE](#). Public comment can also be provided online throughout an amendment's development and during scheduled meetings (Council, APs, SSC). Additionally, a public hearing was held during the Council's regularly scheduled public comment session at the June 2022 meeting. One verbal comment on greater amberjack was received at the public hearing.

Public comments were also received via online submission during public comment periods for Council and Snapper Grouper AP meetings.

Comments on the OFL, ABC, total ACL, and OY are summarized below:

- One comment supported **Alternative 2**.
 - This comment was included in a letter submitted by an organization.
- One comment supported maintaining status quo.

5.1.5. South Atlantic Council Rationale

The current greater amberjack total ACL is set equal to the ABC. The OFL and ABC recommended by the SSC in this amendment would update that value to be based on the best scientific information available. Therefore, setting the ABC, total ACL, and annual OY at the recommended ABC levels is expected to prevent overfishing. The SSC's recommended ABC also accounts for the change in recreational catch estimation from the Marine Recreational Fishing Statistical Survey (MRFSS) methodology to the Marine Recreational Information Program (MRIP) Fishing Effort Survey (FES). Setting the total ACL and annual OY equal to the recommended ABCs decreases the likelihood of accountability measures (AM) being triggered, thus reducing negative impacts to fishing communities. Additionally, with the SEDAR 59 (2020) stock assessment indicating the stock is not overfished and not experiencing overfishing, there is no indication that a buffer between ABC and total ACL is needed to maintain the health of the stock at this time.

The Council chose to maintain the relationship of total ACL and annual OY equaling ABC and update ABC to the values most recently recommended by the SSC by selecting **Preferred Alternative 2**. The Council determined that **Preferred Alternative 2** would best meet the purpose of adjusting catch levels to prevent overfishing of the greater amberjack stock using the best scientific information available while also maximizing social and economic benefits from increased harvest opportunities while the stock's biomass is above B_{MSY} . **Preferred Alternative 2** best meets the goals and objectives of the Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region, as amended, while complying with the requirements of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) and other applicable law.

5.1.6. How is this Action Addressing the Vision Blueprint for the Snapper Grouper Fishery?

This action does not directly respond to objectives in the Vision Blueprint, as adjusting catch levels to prevent overfishing is a mandate under the Magnuson-Stevens Act.

5.2. Action 2. Revise the greater amberjack sector allocations and sector annual catch limits

5.2.1. Snapper Grouper Advisory Panel Comments and Recommendations

The AP discussed Amendment 49 via webinar on April 21-23, 2021, and in-person on April 18-20, 2022. In April 2021, the AP provided the following recommendation:

MOTION: RECOMMEND THE COUNCIL CONSIDER AN ADDITIONAL ACTION 1 ALTERNATIVE OF A CONSISTENT 2.8 MILLION POUND TOTAL ACL AND A PREFERRED ALTERNATIVE OF ACTION 2-ALTERNATIVE 1 (MAINTAIN CURRENT SECTOR ALLOCATIONS).
APPROVED BY AP

The AP received an update on the amendment during their October 19-21, 2021, webinar meeting and had no additional comments at that time.

In April 2022, the AP provided the following recommendation:

MOTION (continued from above): RECOMMEND THE FOLLOWING TO THE COUNCIL:
2. KEEP THE CURRENT ALLOCATION (ACTION 2 - **ALTERNATIVE 1**), 59.34% RECREATIONAL AND 40.66% COMMERCIAL
[Additional components of this motion are listed with their respective actions]
APPROVED BY AP

Rationale for motion: Compromise and working together between sectors and regions for most equitable fishery possible and retaining sustainability in the amberjack fishery. General consensus that the AP does not feel the stock is as healthy as suggested by the assessment.

5.2.2. Law Enforcement Advisory Panel Comments and Recommendations

Alternatives

- 1 (No Action). Retain the current recreational and commercial sector allocations as 59.34% and 40.66%, respectively, of the revised total ACL for greater amberjack.
2. Apply the current allocation formula to the total ACL using the FES-calibrated recreational landings and commercial landings used in SEDAR 59 (2020). This would result in a recreational allocation of 70.16% and a commercial allocation of 29.84%.
- 3. Allocate 65.00% of the total ACL to the recreational sector and 35.00% of the ACL to the commercial sector.**
4. Allocate 55.00% of the total ACL to the recreational sector and 45.00% of the total ACL to the commercial sector.
5. Allocate 50.00% of the total ACL to the recreational sector and 50.00% of the total ACL to the commercial sector.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

The Law Enforcement AP convened in Charleston, South Carolina, on February 10, 2022. The Law Enforcement AP received a briefing on the amendment and had no comments or recommendations.

5.2.3. Scientific and Statistical Committee (SSC) Comments and Recommendations

The SSC convened in Charleston, South Carolina, on February 26-28, 2022. The SSC received a briefing on the amendment and had no comments or recommendations.

5.2.4. Public Comments and Recommendations

Scoping hearings were held via webinar on April 14 and 15, 2021. Four written comments were submitted online, and those can be viewed [HERE](#). Nine members of the public attended scoping hearings, though not all attendees provided verbal comments. During scoping:

- Two comments supported **Alternative 3**.
- One comment supported **Alternative 1**.
- One comment supported **Alternative 1**, with secondary preference for **Alternative 3**.

Public comments also were solicited from May 27, 2022, through June 17, 2022, in conjunction with the Council's June 2022 meeting. Seven written comments were submitted online during this comment period, and those can be viewed [HERE](#). Public comment can also be provided online throughout an amendment's development and during scheduled meetings (Council, APs, SSC). Additionally, a public hearing was held during the Council's regularly scheduled public comment session at the June 2022 meeting. One verbal comment on greater amberjack was received at the public hearing.

Public comments were also received via online submission during public comment periods for Council and Snapper Grouper AP meetings.

Comments on sector allocations are summarized below:

- Most comments supported **Alternative 1 (No Action)**.
 - Including one letter from an organization.
 - Some comments stated the current allocation is fair and should remain in place.

5.2.5. South Atlantic Council Rationale

Current sector allocations were developed in the Comprehensive ACL Amendment through an equation that used historic catch data, which included recreational catch estimates from MRFSS. SEDAR 59 and the catch levels recommended by the SSC are based on data that include recreational catch estimates from the MRIP FES, which estimates recreational catch to be greater than was estimated through MRFSS. Greater recreational catch estimates would have a greater probability of exceeding the sector ACL under the current allocation percentages. Therefore, the

recreational allocation percentage should increase to account for the increase in recreational catch estimates under the new estimation method.

Several recently completed assessments for other snapper grouper species have indicated poor stock status and necessitated reduced harvest of commercially significant snapper grouper stocks, making greater amberjack potentially more important to the commercial sector in future years. Therefore, while the recreational percentage allocation needs to be increased due to the change in recreational catch estimates, it does not need to be changed to the extent of applying the current allocation formula to landings that include the MRIP FES estimates (Action 2-**Alternative 2**). A less extreme shift in allocation toward the recreational sector could more fairly meet the needs of both sectors.

Preferred Alternative 3 increases the allocation percentage for the recreational sector, which lessens the probability of that sector exceeding its ACL under the new recreational survey method. . **Preferred Alternative 3** is also an approximate midpoint between the current allocation percentages and those resulting from the same allocation equation using MRIP FES catch estimates for the recreational sector. **Preferred Alternative 3** with total ACL from Action 1-**Preferred Alternative 2** is also not expected to result in closures due to meeting the ACL for either sector, based on recent average harvest levels.

National Standard 4 requires that allocations be:

- (1) Fair and equitable to all such fishermen.
- (2) Reasonably calculated to promote conservation.
- (3) Carried out in such manner that no particular individual, corporation, or other entity acquires an excessive share of such privileges.

Preferred Alternative 3 addresses National Standard 4 by:

- encouraging a rational use of the resource to optimize social and economic benefits for all sectors and components,
- providing fishing opportunities throughout the fishing year and throughout the South Atlantic region,
- and maintaining the greater amberjack resource to ensure it remains available to a diverse group of users.

5.2.6. How is this Action Addressing the Vision Blueprint for the Snapper Grouper Fishery?

This action addresses actions under Strategies 6.1: *Support management approaches that consider the mechanics of designing allocation strategies* and 6.2: *Identify alternative methods for determining allocation shifts and managing allocations within the fishery* under Objective 6 – *Develop management measures that support optimal sector allocations for the Snapper Grouper Fishery*.

5.3. Action 3. Reduce the commercial minimum size limit for greater amberjack

5.3.1. Snapper Grouper Advisory Panel Comments and Recommendations

The Snapper Grouper AP discussed Amendment 49 via webinar on April 21-23, 2021, and in-person on April 18-20, 2022. In April 2021, the Snapper Grouper AP provided the following comments and recommendations:

- The Snapper Grouper AP discussed decreasing the commercial minimum size limit. A fish near 36 inches is quite large and means fish near this limit are more likely to need to be gaffed to be measured. This could impact survivorship of the fish after release.
- Florida’s state commercial minimum size limit is 36 inches, which was part of the reasoning for setting the federal minimum size limit at that length, as opposed to other options considered.
- Smaller greater amberjack are preferred due to fewer potential for worms, less potential for ciguatera toxin, easier/quicker to board for increased trip efficiency and to reduce damage to fish that are potentially discarded due to the size limit.
- Increasing harvest of preferred, smaller fish may be biologically beneficial, as larger fish won’t be harvested as often and will be left to spawn in the future.
- Consideration should be given to reproductive capabilities in potentially changing the size limit(s).
- Consider decreasing the commercial minimum size limit (34 inches, 32 inches, or 30 inches).
- Consider equal commercial and recreational size limit of 28 inches, 30 inches, or 32 inches.

Alternatives
1 (No Action). The current commercial minimum size limit is 36 inches FL.
2. Decrease the commercial minimum size limit to 34 inches FL
3. Decrease the commercial minimum size limit to 32 inches FL
4. Decrease the commercial minimum size limit to 30 inches FL
5. Decrease the commercial minimum size limit to 28 inches FL
*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

The Snapper Grouper AP received an update on the amendment during their October 19-21, 2021, webinar meeting and had no additional comments at that time.

In April 2022, the Snapper Grouper AP provided the following recommendation:

MOTION (continued from above): RECOMMEND THE FOLLOWING TO THE COUNCIL:

3. CHANGE THE COMMERCIAL MINIMUM SIZE LIMIT TO 34 INCHES.

[(ALTERNATIVE 2)]

[Additional components of this motion are listed with their respective actions]

APPROVED BY AP

Rationale for motion: Compromise and working together between sectors and regions for most equitable fishery possible and retaining sustainability in the amberjack fishery. General consensus that the Snapper Grouper AP does not feel the stock is as healthy as suggested by the assessment.

5.3.2. Law Enforcement Advisory Panel Comments and Recommendations

The Law Enforcement AP convened in Charleston, South Carolina, on February 10, 2022. The Law Enforcement AP received a briefing on the amendment and had no comments or recommendations.

5.3.3. Scientific and Statistical Committee (SSC) Comments and Recommendations

The SSC convened in Charleston, South Carolina, on February 26-28, 2022. The SSC received a briefing on the amendment and had no comments or recommendations.

5.3.4. Public Comments and Recommendations

Scoping hearings were held via webinar on April 14 and 15, 2021. Four written comments were submitted online, and those can be viewed [HERE](#). Nine members of the public attended scoping hearings, though not all attendees provided verbal comments. During scoping, an action considering reduction of the commercial minimum size limit had not yet been included in the amendment. The following comments related to the commercial minimum size limit were received during scoping:

- Two comments supported a reduction or removal of the 36-inch commercial minimum size limit.
- One comment stated that larger greater amberjack are more susceptible to shark depredation due to larger size and longer fighting times. Smaller greater amberjack are brought onboard more quickly, but are more likely to be beneath the minimum size limit and subject to shark predation upon release.
- One comment stated that smaller amberjack are more commercially marketable due to fewer parasites and lower risk of ciguatera poisoning.

Public comments also were solicited from May 27, 2022, through June 17, 2022, in conjunction with the Council's June 2022 meeting. Seven written comments were submitted online during this comment period, and those can be viewed [HERE](#). Public comment can also be provided online throughout an amendment's development and during scheduled meetings (Council, APs, SSC). Additionally, a public hearing was held during the Council's regularly scheduled public comment session at the June 2022 meeting. One verbal comment on greater amberjack was received at the public hearing. Comments on the commercial minimum size limit received during the public comment period are summarized below:

Public comments were also received via online submission during public comment periods for Council and Snapper Grouper AP meetings.

Comments on the commercial minimum size limit are summarized below:

- Action 3 received the most comments of any single action in Amendment 49.
- Most comments supported a reduction of the commercial minimum size limit.
 - 2 of these comments supported making the commercial minimum size limit the same as the current recreational minimum size limit, 28 inches (**Alternative 5**).
 - 1 of these comments was included in a letter submitted by an organization.
 - 2 of these comments supported a 32-inch commercial minimum size limit (**Preferred Alternative 3**).
 - 1 of these comments supported a commercial minimum size limit between 30 and 33 inches.
 - 1 of these comments supported equal commercial and recreational minimum size limits at 32 inches (**Preferred Alternative 3** for the commercial sector), stating this would be fairer and easier to enforce than different size limits for each sector.
 - Comments to reduce the commercial minimum size limit were supported by rationale that included reducing shark depredation, fewer parasites in smaller greater amberjack, and increased numbers of large spawning females.
- One comment supported maintaining the current commercial minimum size limit of 36 inches (**Alternative 1 (No Action)**), and stated that the recreational minimum size limit should be increased to equal that of the commercial. This comment stated that equal size limits for both sectors would reduce confusion about regulation differences between sectors and regions (referring to the Gulf of Mexico minimum size limit of 36 inches).
- One comment supported aligning the commercial and recreational size limits for greater amberjack to reduce confusion and regulatory discards

5.3.5. South Atlantic Council Rationale

The Council added consideration of reducing the commercial minimum size limit after hearing a desire for consideration of this change from public comments during scoping and the initial Snapper Grouper AP input. The Council selected **Preferred Alternative 3** to decrease the commercial minimum size limit from 36 inches to 32 inches for similar reasons as those provided through public and Snapper Grouper AP comments: reduced regulatory discards, reduced risk of shark depredation and, greater commercial desirability for smaller fish. The Council discussed the uncertainty of catch projections used to develop ABC when fishing conditions, such as size limits, are changed. Because of this, the Council decided against setting the commercial minimum size limit equal to the recreational 28-inch minimum size limit, but also decided that a reduction to 32 inches likely would not jeopardize the positive stock status, given other management constraints on the commercial sector such as in-season accountability measures, trip limits, and split season quotas.

5.3.6. How is this Action Addressing the Vision Blueprint for the Snapper Grouper Fishery?

This action addresses actions under Strategy 2.5: Consider development of alternative management approaches to expand access to the fishery under Objective 2 – Develop innovative management measures that allow consistent access to the fishery for all sectors, Strategy 3.1: Consider development of management approaches that assist fishery-dependent businesses to operate efficiently and profitably under Objective 3 – Ensure that management decisions help maximize social and economic opportunity for all sectors, and Strategy 4.3: Reconsider management strategies that use size limits to reduce bycatch under Objective 4 – Develop management measures that reduce and mitigate discards.

5.4. Action 4. Increase the commercial trip limits for greater amberjack

5.4.1. Snapper Grouper Advisory Panel Comments and Recommendations

The Snapper Grouper AP discussed Amendment 49 via webinar on April 21-23, 2021, and in-person on April 18-20, 2022. In April 2021, the Snapper Grouper AP provided the following comments and recommendations:

- Consider increasing the commercial Season 2 (September-February) trip limit to 1,200 pounds (same as Season 1/March-August).

The Snapper Grouper AP received an update on the amendment during their October 19-21, 2021, webinar meeting and had no additional comments at that time.

In April 2022, the Snapper Grouper AP provided the following recommendation:

MOTION (continued from above): RECOMMEND THE FOLLOWING TO THE COUNCIL:

4. RETAIN THE CURRENT TRIP LIMIT FOR BOTH COMMERCIAL SEASONS (ACTION 5 – **ALTERNATIVE 1**).

[Additional components of this motion are listed with their respective actions]

APPROVED BY AP

Rationale for motion: Compromise and working together between sectors and regions for most equitable fishery possible and retaining sustainability in the amberjack fishery. General consensus that the Snapper Grouper AP does not feel the stock is as healthy as suggested by the assessment.

5.4.2. Law Enforcement Advisory Panel Comments and Recommendations

The Law Enforcement AP convened in Charleston, South Carolina, on February 10, 2022. The Law Enforcement AP received a briefing on the amendment and had no comments or recommendations.

Alternatives

1 (No Action). The current Season 1 commercial trip limit for greater amberjack is 1,200 lbs, and the Season 2 commercial trip limit is 1,000 lbs.

2. Increase the Season 1 trip limit for greater amberjack to:
Sub-Alt 2a. 1,500 lbs
Sub-Alt 2b 2,000 lbs
Sub-Alt 2c 2,500 lbs

3. Increase the Season 2 trip limit for greater amberjack to:
Sub-Alt 3a. 1,200 lbs
Sub-Alt 3b: 1,500 lbs
Sub-Alt 3c 2,000 lbs
Sub-Alt 3d 2,500 lbs

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

5.4.3. Scientific and Statistical Committee (SSC) Comments and Recommendations

The SSC convened in Charleston, South Carolina, on February 26-28, 2022. The SSC received a briefing on the amendment and had no comments or recommendations.

5.4.4. Public Comments and Recommendations

Scoping hearings were held via webinar on April 14 and 15, 2021. Four written comments were submitted online, and those can be viewed [HERE](#). Nine members of the public attended scoping hearings, though not all attendees provided verbal comments. During scoping, an action considering increase of the commercial trip limit had not yet been included in the amendment. No comments specific to commercial trip limits were received during scoping.

Public comments also were solicited from May 27, 2022, through June 17, 2022, in conjunction with the Council's June 2022 meeting. Seven written comments were submitted online during this comment period, and those can be viewed [HERE](#). Public comment can also be provided online throughout an amendment's development and during scheduled meetings (Council, APs, SSC). Additionally, a public hearing was held during the Council's regularly scheduled public comment session at the June 2022 meeting. One verbal comment on greater amberjack was received at the public hearing.

Public comments were also received via online submission during public comment periods for Council and Snapper Grouper AP meetings.

Comments on the commercial trip limit are summarized below:

- Most comments supported a 1500-pound trip limit for the entire year (**Alternative 2-Sub-Alternative 2a** and **Preferred Alternative 3-Sub-Alternative 3b**), noting the increased ACL and benefits of increased trip efficiency such as offsetting rising fuel and other fishing-related expenses.
- One comment supported increasing the commercial trip limit to 2,000 pounds (**Alternative 2-Sub-Alternative 2b** for season 1 and **Preferred Alternative 3-Sub-Alternative 3c** for season 2).
- One comment supported a 3-fish possession limit for both sectors.

5.4.5. South Atlantic Council Rationale

The Council added consideration of increasing the seasonal commercial trip limits after hearing a desire for consideration of this change from the Snapper Grouper AP during their initial input. The Council selected **Preferred Alternative 3 – Preferred Sub-Alternative 3a** to increase the commercial minimum size limit in season 2 (August-February) from 1,000 pounds to 1,200 pounds. The Council selected this option to have more regulatory consistency by having the same commercial trip limit throughout the year. Analyses considered in this amendment indicate

that under this limit, the commercial sector is not expected to experience a closure in season 2 (Appendix F).

5.4.6. How is this Action Addressing the Vision Blueprint for the Snapper Grouper Fishery?

This action addresses actions under Strategy 3.1: *Consider development of management approaches that assist fishery-dependent businesses to operate efficiently and profitably under Objective 3 – Ensure that management decisions help maximize social and economic opportunity for all sectors.*

5.5. Action 5. Revise the April spawning closure for greater amberjack

5.5.1. Snapper Grouper Advisory Panel Comments and Recommendations

The Snapper Grouper AP discussed Amendment 49 via webinar on April 21-23, 2021, and in-person on April 18-20, 2022. In April 2021, the Snapper Grouper AP provided the following recommendation:

- Consider including the recreational sector in the April closure of Greater Amberjack, allowing sale of commercially-landed fish during April, or full closure for both sectors (This recommendation was not unanimous).

The Snapper Grouper AP received an update on the amendment during their October 19-21, 2021, webinar meeting and had no additional comments at that time.

In April 2022, the Snapper Grouper AP provided the following comment and recommendation:

- It is important to keep greater amberjack open, including April, as a larger species that can be retained on a recreational trip (South Carolina- Charter).

MOTION (continued from above): RECOMMEND THE FOLLOWING TO THE COUNCIL:

5. KEEP THE APRIL SPAWNING CLOSURE AS IT CURRENTLY IS (ACTION 6 – ALTERNATIVE 1).

[Additional components of this motion are listed with their respective actions]

APPROVED BY AP

Rationale for motion: Compromise and working together between sectors and regions for most equitable fishery possible and retaining sustainability in the amberjack fishery. General consensus that the Snapper Grouper AP does not feel the stock is as healthy as suggested by the assessment.

5.5.2. Law Enforcement Advisory Panel Comments and Recommendations

Alternatives

1. (No Action). During April each year, no person may sell or purchase a greater amberjack harvested from the South Atlantic EEZ and the harvest and possession limit is one per person per day or one per person per trip, whichever is more restrictive.

2. Specify during April each year, no person may sell or purchase, harvest or possess a greater amberjack from the South Atlantic EEZ and the harvest and possession limit is zero.

3. Remove the April spawning closure for greater amberjack. Allow purchase, harvest, and possession of greater amberjack from the South Atlantic EEZ according to regulations specified for the rest of the year.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

The Law Enforcement AP convened in Charleston, SC, on February 10, 2022. The Law Enforcement AP received a briefing on the amendment and had no comments or recommendations.

5.5.3. Scientific and Statistical Committee (SSC) Comments and Recommendations

The SSC convened in Charleston, South Carolina, on February 26-28, 2022. The SSC received a briefing on the amendment and had no comments or recommendations.

5.5.4. Public Comments and Recommendations

Scoping hearings were held via webinar on April 14 and 15, 2021. Four written comments were submitted online, and those can be viewed [HERE](#). Nine members of the public attended scoping hearings, though not all attendees provided verbal comments. During scoping, an action considering revision of the April spawning closure had not yet been included in the amendment. No comments specific to the April spawning closure were received during scoping.

Public comments also were solicited from May 27, 2022, through June 17, 2022, in conjunction with the Council's June 2022 meeting. Seven written comments were submitted online during this comment period, and those can be viewed [HERE](#). Public comment can also be provided online throughout an amendment's development and during scheduled meetings (Council, APs, SSC). Additionally, a public hearing was held during the Council's regularly scheduled public comment session at the June 2022 meeting. One verbal comment on greater amberjack was received at the public hearing. Comments on the April spawning closure received during the public comment period are summarized below:

- Most comments supported removal of the April spawning closure (**Alternative 3**).
- Two comments supported the allowance to sell commercial greater amberjack harvested during the April spawning closure. One of these comments additionally stated that if commercial sale would remain closed, then there should be a complete closure of both sectors in April (**Preferred Alternative 2**).
- One comment supported maintaining the April spawning closure (**Alternative 1 (No Action)**).
 - This comment stated that the closure has helped the sustainability of the greater amberjack stock.

5.5.5. How is this Action Addressing the Vision Blueprint for the Snapper Grouper Fishery?

The Council added consideration of revising the April spawning closure after hearing a desire for consideration of this change from the Snapper Grouper AP during their initial input. The Council selected **Preferred Alternative 2** to revise the April spawning closure to be a complete closure of both sectors during April. The Council selected this option to have more sector equity. Currently during April, the commercial sector is restricted to the recreational possession limit of 1 fish per person per day or one per person per trip, whichever is more restrictive, and is

not allowed to sell that fish. During April, the recreational sector is allowed to operate under the same possession limits that they have the rest of the year. The Council determined that to protect greater amberjack during a portion of their peak spawning period (April-May), both sectors should fully participate in this effort by not allowing either sector to harvest greater amberjack.

5.5.6. How is this Action Addressing the Vision Blueprint for the Snapper Grouper Fishery?

This action addresses actions under Strategy 2.3: Support development of management approaches that account for the seasonality of the snapper grouper fishery under Objective 2 – Develop innovative management measures that allow consistent access to the fishery for all sectors, Strategy 4.1: Consider management approaches that consider catch limits, seasons, and the biology of the fishery in order to minimize bycatch of snapper grouper species under Objective 4 – Develop management measures that reduce and mitigate discards.

5.6. Action 6. Remove recreational annual catch targets from the Snapper Grouper Fishery Management Plan

5.6.1. Snapper Grouper Advisory Panel Comments and Recommendations

The Snapper Grouper AP discussed Amendment 49 via webinar on April 21-23, 2021, and in-person on April 18-20, 2022. In April 2021, the Snapper Grouper AP provided the following recommendation:

MOTION 3: RECOMMEND THE COUNCIL SELECT ACTION 3-**ALTERNATIVE 2** AS PREFERRED (REMOVING RECREATIONAL ACTS). APPROVED BY AP

The Snapper Grouper AP received an update on the amendment during their October 19-21, 2021, webinar meeting and had no additional comments at that time.

5.6.2. Law Enforcement Advisory Panel Comments and Recommendations

The Law Enforcement AP convened in Charleston, South Carolina, on February 10, 2022. The Snapper Grouper AP received a briefing on the amendment and had no comments or recommendations.

5.6.3. Scientific and Statistical Committee (SSC) Comments and Recommendations

The SSC convened in Charleston, South Carolina, on February 26-28, 2022. The SSC received a briefing on the amendment and had no comments or recommendations.

5.6.4. Public Comments and Recommendations

Scoping hearings were held via webinar on April 14 and 15, 2021. Four written comments were submitted online, and those can be viewed [HERE](#). Nine members of the public attended scoping hearings, though not all attendees provided verbal comments. No comments specific to recreational ACTs were received during scoping.

Public comments also were solicited from May 27, 2022, through June 17, 2022, in conjunction with the Council's June 2022 meeting. Seven written comments were submitted online during this comment period, and those can be viewed [HERE](#). Public comment can also be provided online throughout an amendment's development and during scheduled meetings (Council, APs,

Alternatives

1 (No Action). Retain current recreational annual catch targets for species managed under the Snapper Grouper FMP.

2. Remove current recreational annual catch targets for species managed under the Snapper Grouper FMP.

*See Chapter 2 for detailed language of alternatives. Preferred indicated in bold.

SSC). Additionally, a public hearing was held during the Council’s regularly scheduled public comment session at the June 2022 meeting. One verbal comment on greater amberjack was received at the public hearing.

Public comments were also received during public comment periods for Council and Snapper Grouper AP meetings.

Comments on the commercial trip limit are summarized below:

- One comment supported **Preferred Alternative 2**.
 - This comment was included in a letter submitted by an organization.

5.6.5. South Atlantic Council Rationale

The Council does not currently use recreational ACTs in its management of snapper grouper species, but the ACTs must be updated when the recreational ACLs change under the FMP. Removal of recreational ACTs from the FMP (**Preferred Alternative 2**) would reduce an administrative burden without affecting the Council’s ability under the FMP to manage the snapper grouper fishery. The Council determined that ACTs were not necessary because the Council accounts for any management uncertainty when setting ACLs. Additionally, if use of an ACT were desired in the future, the Council could add an ACT back into the FMP on a case-by-case basis through a future amendment.

5.6.6. How is this Action Addressing the Vision Blueprint for the Snapper Grouper Fishery?

This action does not directly address management objectives in the Vision Blueprint. Removal of recreational ACTs does not impact effective management of snapper grouper species.

Chapter 6. Cumulative Effects

While this environmental assessment (EA) is being prepared using the 2020 Council on Environmental Quality (CEQ) National Environmental Policy Act (NEPA) Regulations, the cumulative effects discussed in this section meet the two-part standard for “reasonable foreseeability” and “reasonably close causal connection” required by the new definition of effects or impacts. Below is the five-step cumulative effects analysis that identifies criteria that must be considered in an EA.

6.1. Affected Area

The immediate impact area would be the federal 200-mile limit of the Atlantic off the coasts of North Carolina, South Carolina, Georgia, and east Florida to Key West, which is also the South Atlantic Fishery Management Council’s (Council) area of jurisdiction. In light of the available information, the extent of the boundaries would depend upon the degree of fish immigration/emigration and larval transport, whichever has the greatest geographical range. The ranges of affected species are described in Volume II of the Fishery Ecosystem Plan.¹⁹ For the proposed actions found in Amendment 49 to the Fishery Management Plan (FMP) for the Snapper Grouper Fishery of the South Atlantic Region (Snapper Grouper FMP), the cumulative effects analysis includes an analysis of data from 2017 through the present.

6.2. Past, Present, and Reasonably Foreseeable Actions Impacting the Affected Area

Fishery managers implemented the first significant regulations pertaining to snapper grouper species in 1983 through the Snapper Grouper FMP (SAFMC 1983). Listed below are other past, present, and reasonably foreseeable actions occurring in the South Atlantic Region. These actions, when added to the proposed management measures, may result in cumulative effects on the biophysical and socio-economic environment.

Past Actions

Amendment 36 to the Snapper Grouper FMP, effective on July 31, 2017, was implemented to establish new spawning special management zones (SMZ) to protect spawning areas for snapper grouper species.

Amendment 37 to the Snapper Grouper FMP, effective on August 24, 2017, modified the hogfish fishery management unit in response to genetically different stocks along the South Atlantic, specified fishing levels for the two stocks, established a rebuilding plan for the Florida Keys/East Florida stock, and established or revised management measures for both hogfish stocks such as size limits, recreational bag limits, and commercial trip limits.

Amendment 43 to the Snapper Grouper FMP, effective on July 26, 2017, specified recreational and commercial annual catch limits (ACL) for red snapper beginning in 2018.

¹⁹For more information, see Section 3.1

DRAFT DOCUMENT

Abbreviated Framework 1 to the Snapper Grouper FMP, effective on August 27, 2018, was implemented to address overfishing of red grouper, and reduced the commercial and recreational ACLs for red grouper in the South Atlantic exclusive economic zone (EEZ).

Abbreviated Framework 2 to the Snapper Grouper FMP, effective on May 9, 2019, revised fishing levels for black sea bass and vermilion snapper in response to the latest stock assessments for those species in the South Atlantic.

Amendment 42 to the Snapper Grouper FMP, effective on January 8, 2020, added three newly approved sea turtle release devices and updated the regulations to simplify and clarify the specifications for other release gear requirements. The new devices and updates provide more options to fulfill the requirements for sea turtle release gear on board vessels with commercial and charter/for-hire snapper grouper permits in the South Atlantic. The amendment also streamlines the procedure to implement newly approved devices and handling procedures in the future.

Vision Blueprint Commercial Regulatory Amendment 27 to the Snapper Grouper FMP, effective on February 26, 2020, addresses specific action items in the 2016-2020 Vision Blueprint for the commercial sector of the snapper grouper fishery. The framework amendment revised commercial regulations for blueline tilefish, snowy grouper, greater amberjack, red porgy, vermilion snapper, almaco jack, Other Jacks Complex (lesser amberjack, almaco jack, and banded rudderfish), queen snapper, silk snapper, blackfin snapper, and gray triggerfish. Actions include modifying fishing seasons, trip limits, and minimum size limits.

Regulatory Amendment 30 to the Snapper Grouper FMP, effective on March 9, 2020, revised the rebuilding plan for red grouper, extended the annual spawning closure for that species off North and South Carolina, and established a commercial trip limit.

Regulatory Amendment 26 (Vision Blueprint Regulatory Amendment 26) to the Snapper Grouper FMP, effective on March 30, 2020, addresses specific action items in the 2016-2020 Vision Blueprint for the recreational sector of the snapper grouper fishery. The framework amendment modified the 20-fish aggregate bag limits, and minimum size limits for certain species.

Regulatory Amendment 29 to the Snapper Grouper FMP, effective July 15, 2020, modified gear requirements for South Atlantic snapper grouper species. Actions included requirements for descending and venting devices, and modifications to requirements for circle hooks and powerheads.

Abbreviated Framework 3 to the Snapper Grouper FMP, effective August 17, 2020, revised fishing levels for blueline tilefish in the South Atlantic region.

Regulatory Amendment 33 to the Snapper Grouper FMP, effective August 17, 2020, removed the requirement that if projections indicate the South Atlantic red snapper season (commercial or recreational) would be three days or fewer, the commercial and/or recreational seasons would not

DRAFT DOCUMENT

open for that fishing year. If this requirement is removed, red snapper harvest could be open for either recreational or commercial harvest for fewer than four days.

Amendment 39 to the Snapper Grouper FMP, effective September 1, 2020 (corrected January 4, 2021), modified reporting requirements for federally-permitted charter vessels and headboats in the snapper grouper, dolphin wahoo, and coastal migratory pelagics (mackerel and cobia) fisheries.

Regulatory Amendment 34 to the Snapper Grouper FMP, effective May 3, 2021, created 34 special management zones around artificial reefs off North Carolina and South Carolina.

Present Actions

Regulatory Amendment 35 to the Snapper Grouper FMP will address results of the latest stock assessment for the red snapper stock in the southeast, release mortality issues in the snapper grouper fishery, and modifications to red snapper catch levels.

Amendment 44 to the Snapper Grouper FMP will address the results of the latest stock assessment for the yellowtail snapper stock in the southeast.

Comprehensive Acceptable Biological Catch (ABC) Control Rule Amendment (Amendment 45 to the Snapper Grouper FMP) would modify the ABC control rule, specify an approach for determining the acceptable risk of overfishing and the probability of rebuilding success for overfished stocks, allow phase-in of ABC changes, and allow carry-over of unharvested catch. This amendment will continue being developed in 2021.

Amendment 50 to the Snapper Grouper FMP would address the results of the latest stock assessment for the red porgy stock in the South Atlantic region. Red porgy are overfished and overfishing is occurring. The Council is required to establish a rebuilding plan by June 2022 and adjust catch levels and management measures to end overfishing.

Amendment 51 to the Snapper Grouper FMP would address the results of the latest stock assessment for the snowy grouper stock in the South Atlantic region. Snowy grouper was determined to be overfished and undergoing overfishing.

Amendment 52 to the Snapper Grouper FMP would respond to the latest stock assessment for golden tilefish (SEDAR 66). Golden tilefish are not overfished and overfishing is not occurring. The amendment would also respond to increased recreational effort on blueline tilefish by adjusting the recreational bag limit for blueline tilefish and modifying recreational accountability measures.

Amendment 53 to the Snapper Grouper FMP would address the results of the latest stock assessment for the gag stock in the South Atlantic region. Gag was determined to be overfished and undergoing overfishing.

Reasonably Foreseeable Future Actions

Amendment 46 to the Snapper Grouper FMP proposes actions to focus on private recreational permit requirements and reporting. Development of this amendment is currently on hold. Regulatory Amendment 31 to the Snapper Grouper FMP could include actions to revise recreational accountability measures to allow more flexibility in managing recreational fisheries.

Expected Impacts from Past, Present, and Future Actions

The intent of Amendment 49 is to modify management of South Atlantic greater amberjack. Actions include revising annual catch limits (ACL), sector allocations, and management measures for the commercial and recreational sectors. Development of Amendment 49 is a response to the most recent stock assessment for South Atlantic greater amberjack (SEDAR 59 2020). The proposed actions in Amendment 49 are not expected to result in significant cumulative adverse biological or socio-economic effects (see Chapter 4). In recent years, participants in the snapper grouper fishery and associated businesses have experienced some negative economic and social impacts due to changes in ACLs and early closures during the fishing years. Factors such as distance to fishing grounds, weather, and water temperature affect availability of species to the recreational fleets in different parts of the Council’s jurisdiction. The proposed actions could result in decreased regulatory discards of greater amberjack.

When combined with the impacts of past, present, and future actions affecting the snapper grouper fishery, minor cumulative impacts are likely to accrue. For example, there could be beneficial cumulative effects from the actions in this amendment, in addition to future proposed actions to reduce overfishing of snapper grouper species. Also, there may be cumulative socio-economic effects by promoting access to the fishery, which would improve recreational fishing opportunities and benefits to associated businesses and communities; however, the actions in this amendment are not expected to result in significant cumulative adverse biological or socio-economic effects to the snapper grouper fishery when combined with the impacts of past, present, and future actions (see Chapter 4).

6.3. Consideration of Climate Change and Other Non-Fishery Related Issues

Climate Change

Global climate changes could have significant effects on Atlantic fisheries, though the extent of these effects on the dolphin and wahoo, snapper grouper, and golden crab fisheries is not known at this time. The Environmental Protection Agency’s climate change webpage (<https://www.epa.gov/climate-indicators/marine-species-distribution>), and NOAA’s Office of Science and Technology climate webpage (<https://www.fisheries.noaa.gov/topic/climate>), provides background information on climate change, including indicators which measure or anticipate effects on oceans, weather and climate, ecosystems, health and society, and greenhouse gases. The United Nations Intergovernmental Panel on Climate Change’s Sixth Assessment Report (February 28, 2022), U.S. Global Change Research Program (USGCRP)’s Fourth Climate Assessment (2018), and the Ecosystem Status Report for the U.S. South Atlantic Region (Craig et al. 2021) also provide a compilation of scientific information on climate change. Those findings are summarized below.

Ocean acidification, or a decrease in surface ocean pH due to absorption of anthropogenic carbon dioxide emissions, affects the chemistry and temperature of the water. Increased thermal stratification alters ocean circulation patterns, and causes a loss of sea ice, sea level rise, increased wave height and frequency, reduced upwelling, and changes in precipitation and wind patterns. Changes in coastal and marine ecosystems can influence organism metabolism and alter ecological processes such as productivity, species interactions, migration, range and distribution, larval and juvenile survival, prey availability, and susceptibility to predators. The “center of biomass,” a geographical representation of each species’ weight distribution, is being used to identify the shifting of fish populations. Warming sea temperature trends in the southeast have been documented, and animals must migrate to cooler waters, if possible, if water temperatures exceed survivable ranges (Needham et al. 2012). Rising water temperatures, ocean acidification, retreating arctic sea ice, sea level rise, high-tide flooding, coastal erosion, higher storm surge, and heavier precipitation events are projected to continue, putting ocean and marine species at risk, decreasing the productivity of certain fisheries, and threatening communities that rely on marine ecosystems for livelihoods and recreation (USGCRP 2018). Harvesting and habitat changes also causes geographic population shifts. Changes in water temperatures may also affect the distribution of native and exotic species, allowing invasive species to establish communities in areas they may not have been able to survive previously. The numerous changes to the marine ecosystem may cause an increased risk of disease in marine biota. An increase in the occurrence and intensity of toxic algae blooms will negatively influence the productivity of keystone animals, such as corals, and critical coastal ecosystems such as wetlands, estuaries, and coral reefs (Kennedy et al. 2002; IPCC 2022). Free et al. (2019) investigated the impacts of historical warming on marine fisheries production and found that climate change is altering habitats for marine fishes and invertebrates, but the net effect of these changes on potential food production is unknown.

Climate driven movement of fish stocks is causing commercial, small-scale, artisanal, and recreational fishing activities to shift poleward and diversify harvests (IPCC 2022). In the South Atlantic Region, species richness and abundance of offshore hard bottom reef fishes have generally declined over time while richness and abundance of demersal fishes in soft sediment habitats on the nearshore shelf have increased. Potential explanations for these patterns include changes in harvest (directed and bycatch), trophic interactions, and environment effects on recruitment (Craig et al. 2021). Climate change may impact dolphin and wahoo, snapper grouper species, and golden crab in the future, but the level of impacts cannot be quantified at this time, nor is the time frame known in which these impacts will occur. Public comments stating the lack of large dolphin in the Florida Keys may have to do with the fish moving out of the area in search of suitable temperature and food availability. Studies have shown that seasonal abundance of dolphin along the east coast of the U.S. and Gulf of Mexico is heavily influenced by sea surface temperature and distance to temperature fronts, chlorophyll-*a* concentration, and *Sargassum* mats (Kleisner 2009; Farrell et al. 2014; Merten et al. 2014). Patterns from stock assessments in the South Atlantic Region indicate biomass of most assessed species generally show declines from the 1970s through the 1990s with some species showing signs of recovery beginning in the early to mid-2000s. Recruitment of a number of snapper-grouper species has declined since the early 2010s whereas recruitment of Red Snapper and some pelagic species has increased in recent years (Craig et al. 2021). In the near term, it is unlikely that the actions in Comprehensive Acceptable Biological Catch Control Rule

Amendment would compound or exacerbate the ongoing effects of climate change on dolphin and wahoo, snapper grouper species, and golden crab.

Weather Variables

Hurricane season is from June 1 to November 30, and accounts for 97% of all tropical activity affecting the Atlantic basin. These storms, although unpredictable in their annual occurrence, can devastate areas when they occur. Although these effects may be temporary, those fishing-related businesses whose profitability is marginal may go out of business if a hurricane strikes.

6.4. Overall Impacts Expected from Past, Present, and Future Actions

The proposed management actions are summarized in Chapter 2 of this document. Detailed discussions of the magnitude and significance of the impacts of the alternatives on the human environment appear in Chapter 4 of this document. None of the impacts of the actions in this amendment, in combination with past, present, and future actions have been determined to be significant. Although several other management actions, in addition to this amendment, are expected to affect snapper grouper species, any additive effects, beneficial and adverse, are not expected to result in a significant level of cumulative impacts.

The proposed actions would not adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places as these are not in the South Atlantic EEZ. These actions are not likely to result in direct, indirect, or cumulative effects to unique areas, such as significant scientific, cultural, or historical resources, park land, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas as the proposed action is not expected to substantially increase fishing effort or the spatial and/or temporal distribution of current fishing effort within the South Atlantic region. The U.S. Monitor, Gray's Reef, and Florida Keys National Marine Sanctuaries are within the boundaries of the South Atlantic EEZ. The proposed actions are not likely to cause loss or destruction of these national marine sanctuaries because the actions are not expected to result in appreciable changes to current fishing practices. Additionally, the proposed actions are not likely to change the way in which the snapper grouper fishery is prosecuted; therefore, the actions are not expected to result in adverse impacts on health or human safety beyond the status quo.

6.5. Monitoring and Mitigation

Fishery-independent and fishery-dependent data comprise a significant portion of information used in stock assessments. Fishery-independent data are being collected through the Southeast Fishery Information Survey and the Marine Resources Monitoring Assessment and Prediction Program. The effects of the proposed actions are, and would continue to be, monitored through collection of recreational landings data by all the four states in the South Atlantic Region (Florida, Georgia, South Carolina, and North Carolina). The National Marine Fisheries Service would continue to monitor and collect information on snapper grouper species for stock assessments and stock assessment updates, life history studies, economic and social analyses, and other scientific observations. The proposed actions relate to the harvest of indigenous

DRAFT DOCUMENT

species in the Atlantic, and the activities/regulations being altered do not introduce non-indigenous species, and are not reasonably expected to facilitate the spread of such species through depressing the populations of native species. Additionally, these alternatives do not propose any activity, such as increased ballast water discharge from foreign vessels, which is associated with the introduction or spread on non-indigenous species.

Chapter 7. List of Preparers

Table 7.1. List of Interdisciplinary Planning Team Members for Amendment 49 to the Snapper Grouper Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region

Name	Agency/Division	Title
Mike Schmidtke	SAFMC	Fishery Scientist/IPT Lead
Myra Brouwer	SAFMC	Deputy Director for Management
Chip Collier	SAFMC	Deputy Director for Science and Statistics
Christina Wiegand	SAFMC	Social Scientist
John Hadley	SAFMC	Economist
Cameron Rhodes	SAFMC	Outreach Program Manager
Mary Vara	SERO/SF	Fishery Biologist/IPT Lead
Rick DeVictor	SERO/SF	South Atlantic Branch Chief
Scott Sandorf	SERO/SF	Technical Writer and Editor
Jeff Pulver	SERO/SF	Data Analyst
Mike Larkin	SERO/SF	Data Analyst
Christina Package-Ward	SERO/SF	Social Scientist
David Records	SERO/SF	Economist
Pat O'Pay	SERO/PR	Biologist
David Dale	SERO/Habitat	Regional EFH Coordinator
Shepherd Grimes	NOAA GC	General Counsel
Monica Smit-Brunello	NOAA GC	General Counsel
Manny Antonaras	SERO/OLE	Deputy Special Agent in Charge
Matt Walia	SERO/OLE	Enforcement Technician
Kevin Craig	SEFSC	Biologist
David Carter	SEFSC	Economist

HC = Habitat Conservation Division, GC = General Counsel, NMFS = National Marine Fisheries Service, PR = Protected Resources Division, SAFMC = South Atlantic Fishery Management Council, SEFSC = Southeast Fisheries Science Center, SERO = Southeast Regional Office, SF = Sustainable Fisheries Division, OLE = Office of Law Enforcement

Appendix A. Other Applicable Law

A.1. Administrative Procedure Act (APA)

All federal rulemaking is governed under the provisions of the APA (5 U.S.C. Subchapter II), which establishes a “notice and comment” procedure to enable public participation in the rulemaking process. Among other things under the APA, the National Marine Fisheries Service (NMFS) is required to publish notification of proposed rules in the *Federal Register* and to solicit, consider and respond to public comment on those rules before they are finalized. The APA also establishes a 30-day wait period from the time a final rule is published until it takes effect, with some exceptions. Amendment 49 to the Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region (Amendment 49) complies with the provisions of the APA through the South Atlantic Fishery Management Council’s (Council) extensive use of public meetings, requests for comments and consideration of comments. The proposed rule associated with this plan amendment will have a request for public comments, which complies with the APA, and upon publication of the final rule, unless the rule falls within an APA exception, there will be a 30-day wait period before the regulations are effective.

A.2. Information Quality Act (IQA)

The IQA (Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (Public Law 106-443)) which took effect October 1, 2002, directed the Office of Management and Budget (OMB) to issue government-wide guidelines that “provide policy and procedural guidelines to federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information disseminated by federal agencies.” OMB directed each federal agency to issue its own guidelines, establish administrative mechanisms allowing affected persons to seek and obtain correction of information that does not comply with OMB guidelines, and report periodically to OMB on the number and nature of complaints. The NOAA Section 515 Information Quality Guidelines require a series of actions for each new information product subject to the IQA. Amendment 49 uses the best available information and made a broad presentation thereof. The information contained in this document was developed using best available scientific information. Therefore, this document is in compliance with the IQA.

A.3. Coastal Zone Management Act (CZMA)

Section 307(c)(1) of the federal CZMA of 1972 requires that all federal activities that directly affect the coastal zone be consistent with approved state coastal zone management programs to the maximum extent practicable. While it is the goal of the Council to have management measures that complement those of the states, federal and state administrative procedures vary and regulatory changes are unlikely to be fully instituted at the same time. The Council believes the actions in this plan amendment are consistent to the maximum extent practicable with the Coastal Zone Management Plans of Florida, Georgia, South Carolina, and North Carolina. Pursuant to Section 307 of the CZMA, this determination will be submitted to the responsible state agencies who administer the approved Coastal Zone Management Programs in the States of Florida, South Carolina, Georgia, and North Carolina.

A.4. Executive Order 12612: Federalism

Executive Order (E.O.) 12612 requires agencies to be guided by the fundamental federalism principles when formulating and implementing policies that have federalism implications. The purpose of the Order is to guarantee the division of governmental responsibilities between the federal government and the states, as intended by the framers of the Constitution. No federalism issues have been identified relative to the actions proposed in this document and associated regulations. Therefore, preparation of a Federalism assessment under E.O. 12612 is not necessary.

A.5. Executive Order 12962: Recreational Fisheries

E.O. 12962 requires federal agencies, in cooperation with states and tribes, to improve the quantity, function, sustainable productivity, and distribution of U.S. aquatic resources for increased recreational fishing opportunities through a variety of methods. Additionally, the Order establishes a seven-member National Recreational Fisheries Coordination Council responsible for, among other things, ensuring that social and economic values of healthy aquatic systems that support recreational fisheries are considered by federal agencies in the course of their actions, sharing the latest resource information and management technologies, and reducing duplicative and cost-inefficient programs among federal agencies involved in conserving or managing recreational fisheries. The National Recreational Fisheries Coordination Council also is responsible for developing, in cooperation with federal agencies, states and tribes, a Recreational Fishery Resource Conservation Plan to include a five-year agenda. Finally, the Order requires NMFS and the U.S. Fish and Wildlife Service to develop a joint agency policy for administering the ESA.

The alternatives considered in this document are consistent with the directives of E.O. 12962.

A.6. Executive Order 13089: Coral Reef Protection

E.O. 13089, signed by President William Clinton on June 11, 1998, recognizes the ecological, social, and economic values provided by the Nation’s coral reefs and ensures that federal agencies are protecting these ecosystems. More specifically, the Order requires federal agencies to identify actions that may harm U.S. coral reef ecosystems, to utilize their program and authorities to protect and enhance the conditions of such ecosystems, and to ensure that their actions do not degrade the condition of the coral reef ecosystem.

The alternatives considered in this document are consistent with the directives of E.O. 13089.

A.7. Executive Order 13158: Marine Protected Areas (MPAs)

E.O. 13158 was signed on May 26, 2000, to strengthen the protection of U.S. ocean and coastal resources through the use of MPAs. The E.O. defined MPAs as “any area of the marine environment that has been reserved by federal, state, territorial, tribal, or local laws or regulations to provide lasting protection for part or all of the natural and cultural resources

therein.” It directs federal agencies to work closely with state, local and non-governmental partners to create a comprehensive network of MPAs “representing diverse U.S. marine ecosystems, and the Nation’s natural and cultural resources.”

The alternatives considered in this document are consistent with the directives of E.O. 13158.

A.8. National Marine Sanctuaries Act (NMSA)

Under the NMSA (also known as Title III of the Marine Protection, Research and Sanctuaries Act of 1972), as amended, the U.S. Secretary of Commerce is authorized to designate National Marine Sanctuaries to protect distinctive natural and cultural resources whose protection and beneficial use requires comprehensive planning and management. The National Marine Sanctuary Program is administered by the Sanctuaries and Reserves Division of NOAA. The NMSA provides authority for comprehensive and coordinated conservation and management of these marine areas. The National Marine Sanctuary Program currently comprises 13 sanctuaries around the country, including sites in American Samoa and Hawaii. These sites include significant coral reef and kelp forest habitats, and breeding and feeding grounds of whales, sea lions, sharks, and sea turtles. The three sanctuaries in the South Atlantic exclusive economic zone are the USS Monitor, Gray’s Reef, and Florida Keys National Marine Sanctuaries.

The alternatives considered in this document are not expected to have any adverse impacts on the resources managed by the National Marine Sanctuaries.

A.9. Paperwork Reduction Act (PRA)

The purpose of the PRA is to minimize the burden on the public. The PRA is intended to ensure that the information collected under the proposed action is needed and is collected in an efficient manner (44 U.S.C. 3501 (1)). The authority to manage information collection and record keeping requirements is vested with the Director of the Office of Management and Budget (OMB). This authority encompasses establishment of guidelines and policies, approval of information collection requests, and reduction of paperwork burdens and duplications. The PRA requires NMFS to obtain approval from the OMB before requesting most types of fishery information from the public. Actions in this document are not expected to affect PRA.

A.10. Small Business Act (SBA)

Enacted in 1953, the SBA requires that agencies assist and protect small-business interests to the extent possible to preserve free competitive enterprise. The objectives of the SBA are to foster business ownership by individuals who are both socially and economically disadvantaged; and to promote the competitive viability of such firms by providing business development assistance including, but not limited to, management and technical assistance, access to capital and other forms of financial assistance, business training, and counseling, and access to sole source and limited competition federal contract opportunities, to help firms achieve competitive viability. Because most businesses associated with fishing are considered small businesses, NMFS, in

implementing regulations, must make an assessment of how those regulations will affect small businesses.

A.11. Public Law 99-659: Vessel Safety

Public Law 99-659 amended the Magnuson-Stevens Fishery Conservation and Management Act to require that an FMP or FMP amendment must consider, and may provide for, temporary adjustments (after consultation with the U.S. Coast Guard and persons utilizing the fishery) regarding access to a fishery for vessels that would be otherwise prevented from participating in the fishery because of safety concerns related to weather or to other ocean conditions. No vessel would be forced to participate in South Atlantic fisheries under adverse weather or ocean conditions as a result of the imposition of management regulations proposed in this amendment. No concerns have been raised by South Atlantic fishermen or by the U.S. Coast Guard that the proposed management measures directly or indirectly pose a hazard to crew or vessel safety under adverse weather or ocean conditions.

Appendix B. Regulatory Impact Review

B.1. Introduction

The National Marine Fisheries Service (NMFS) requires a Regulatory Impact Review (RIR) for all regulatory actions that are of public interest to satisfy the obligations under Executive Order (E.O.) 12866, as amended. In conjunction with the analysis of direct and indirect effects in the “Environmental Consequences” section of this Amendment, the RIR: 1) provides a comprehensive review of the level and incidence of impacts associated with a regulatory action; 2) provides a review of the problems and policy objectives prompting the regulatory proposals and an evaluation of the major alternatives which could be used to solve the problem; and 3) ensures that the regulatory agency systematically and comprehensively considers all available alternatives so that the public welfare can be enhanced in the most efficient and cost effective way. The RIR also serves as the basis for determining whether any proposed regulations are a "significant regulatory action" under certain criteria provided in Executive Order (E.O.) 12866. In addition, the RIR provides some information that may be used in conducting an analysis of the effects on small entities pursuant to the Regulatory Flexibility Act (RFA). This RIR analyzes the effects this regulatory action would be expected to have on the recreational and commercial sectors of the greater amberjack fishery.

B.2. Problems and Objectives

The problems and objectives for the proposed actions are presented in Section 1.4 of this amendment and are incorporated herein by reference.

B.3. Description of Fisheries

A description of the recreational and commercial sectors of the greater amberjack fishery is provided in Section 3.3 of this amendment and is incorporated herein by reference.

B.4. Effects of Management Measures

Action 1. Revise the greater amberjack overfishing level, acceptable biological catch, total annual catch limit, and annual optimum yield

A detailed analysis and discussion of the expected economic effects of the proposed action is included in Section 4.1.2. The following discussion summarizes the expected economic effects of the Council preferred alternative relative to the No Action alternative (i.e., the status quo).

In general, total ACLs that allow for more fish to be landed can result in increased positive economic effects if harvest increases without notable long-term effects on the health of a stock. The ACL does not directly impact the fishery for a species unless harvest changes, fishing behavior changes, or the ACL is exceeded, thereby potentially triggering AMs such as harvest closures or other restrictive measures. As such, ACLs that are set above the observed landings in

the fishery for a species and do not change harvest or fishing behavior may not have realized economic effects each year. Nevertheless, ACLs set above observed harvest levels do create a gap between the ACL and typical landings that may be utilized in years of exceptional abundance or accessibility to a species, thus providing the opportunity for increased landings and a reduced likelihood of triggering restrictive AMs. As such, there are potential economic benefits from ACLs that allow for such a gap. The opposite is true for ACLs that constrain harvest or fishing effort within a fishery or reduce the previously described gap between average landings and the ACL.

Preferred Alternative 2 would provide the highest ACL of the viable alternatives being considered and would not be constraining on harvest until the 2025-2026 fishing year. In the 2023-2024 fishing year, **Preferred Alternative 2** is estimated to result in an increase in potential net economic benefits of \$309,861 for the commercial sector, a decrease in potential net economic benefits of \$71,606 for the recreational sector, and an increase in potential net economic benefits of \$238,255 for both sectors combined (2020 \$). By the 2026-2027 fishing year and beyond, **Preferred Alternative 2** is estimated to result in an increase in potential net economic benefits of \$171,716 for the commercial sector, a decrease in potential net economic benefits of \$294,895 for the recreational sector, and a decrease in potential net economic benefits of \$123,178 for both sectors combined (2020 \$).

Action 2. Revise the greater amberjack sector allocations and sector annual catch limits

A detailed analysis and discussion of the expected economic effects of the proposed action is included in Section 4.2.2. The following discussion summarizes the expected economic effects of the Council preferred alternative relative to the No Action alternative (i.e., the status quo).

In general, sector ACLs that allow for more fish to be landed can result in increased positive economic effects if harvest increases without notable long-term effects on the health of a stock. The sector ACL does not directly impact the fishery for a species unless harvest changes, fishing behavior changes, or the sector ACL is exceeded, thereby potentially triggering AMs such as harvest closures or other restrictive measures. As such, sector ACLs that are set above observed landings in a fishery for a species and do not change harvest or fishing behavior may not have realized economic effects each year. Nevertheless, sector ACLs set above observed average harvest levels do create a gap between the sector ACL and typical landings that may be utilized in years of exceptional abundance or accessibility of a species, thus providing the opportunity for increased landings and a reduced likelihood of triggering restrictive AMs. As such there are potential economic benefits from sector ACLs that allow for such a gap.

Commercial Sector

Preferred Alternative 3 would result in a comparatively lower commercial sector allocation and sector ACL (35.00% of the total ACL). Although **Preferred Alternative 3** is not estimated to be constraining based on the average annual landings over the last five years of available data and is higher than the current sector ACL of 769,388 lbs gw, it is assumed that the commercial sector could fully harvest its ACL, if conditions allowed, and there would be fewer potential landings of greater amberjack under **Preferred Alternative 3** relative to **Alternative 1 (No Action)**.

These relatively reduced landings would be expected to comparatively decrease total potential producer surplus(PS) for the commercial sector. When compared to **Alternative 1 (No Action)**, **Preferred Alternative 3** would result in an estimated reduction in PS of \$110,233 in fishing year 2023/24 and a reduction in PS of \$91,002 by fishing year 2026/27 (2020 \$).

Recreational Sector

Preferred Alternative 3 would result in a comparatively higher recreational sector allocation and sector ACL (65.00% of the total ACL). Most of the recreational ACLs in **Action 2** are estimated to be constraining based on the average annual landings over the last five years of available data (Table 4.2.2.3), and it is assumed that the recreational sector could fully harvest its ACL if conditions allowed. There would be higher potential landings of greater amberjack under **Alternative 2** and **Preferred Alternative 3** relative to **Alternative 1 (No Action)**. These relatively increased landings would be expected to comparatively increase total consumer surplus (CS) for the recreational sector. **Preferred Alternative 3** with an estimated increase in CS of \$122,085 in fishing year 2023/24 and an increase in CS of \$100,787 by fishing year 2026/27 (2020 \$).

Total

In comparison to **Alternative 1 (No Action)**, **Preferred Alternative 3** would be estimated to increase net economic benefits by \$11,852 in fishing year 2023/24 and increase net economic benefits by \$9,785 in fishing year 2026/27 (2020 \$).

Action 3. Reduce the commercial minimum size limit for greater amberjack

A detailed analysis and discussion of the expected economic effects of the proposed action is included in Section 4.3.2. The following discussion summarizes the expected economic effects of the Council preferred alternative relative to the No Action alternative (i.e., the status quo).

Reducing the commercial minimum size limit for greater amberjack under **Preferred Alternative 3** would increase harvest since smaller fish that were previously discarded due to the current 36-inch minimum size limit (**Alternative 1 (No Action)**) could be landed. This would provide positive direct economic effects for the commercial sector provided there are no long-term negative effects for the stock from the increased harvest. In general, the lower the size limit, the more that overall harvest would increase in the short-term, thereby increasing economic benefits incurred from such harvest. These economic benefits may accrue in the form of increased net revenue for commercial vessels, thus increasing PS for the commercial sector.

Action 4. Increase the seasonal commercial trip limits for greater amberjack

A detailed analysis and discussion of the expected economic effects of the proposed action is included in Section 4.4.2. The following discussion summarizes the expected economic effects of the Council preferred alternative relative to the No Action alternative (i.e., the status quo).

Generally, commercial trip limits are not considered to be economically efficient because they require an increase in the number of trips and associated trip costs to land the same amount of fish. However, the negative economic effects of this inefficiency can be offset by price support

resulting from the supply limitations and the lengthening of seasons. Given the ACL for greater amberjack that restricts maximum harvest to sustainable levels, the alternative with the fewest number of trips that have to stop retaining greater amberjack because the trip limit has been reached would result in the least amount of direct negative economic effects.

Increasing trip limits (**Preferred Alternative 2**) would allow for increased revenue on trips that land greater amberjack, thereby resulting in an increase in economic benefits to commercial vessels participating in the fishery through increased revenue. Higher trip limits would allow for higher levels of revenue in fewer trips, thus potentially increasing net economic benefits through increased net revenue.

The quantitative economic effects of this action are largely captured in the economic effects described in Action 1 and Action 2 for the commercial sector, since increased trip limits would allow for the commercial sector to better utilize the increase in the sector ACL. Thus, the quantitative effects are not necessarily additive to the effects shown in Action 1 and 2, but rather show the estimated economic effects of **Action 4** with all other conditions remaining the same. **Preferred Sub-Alternative 3a** is estimated to increase net economic benefits by \$28,806 (2020 \$).

Action 5. Revise the April spawning closure for greater amberjack

A detailed analysis and discussion of the expected economic effects of the proposed action is included in Section 4.5.1.2. The following discussion summarizes the expected economic effects of the Council preferred alternative relative to the No Action alternative (i.e., the status quo).

In general, providing increased protection for spawning greater amberjack would be expected to result in improvements in stock abundance and biomass and create indirect, long-term, positive economic effects presumably through the availability of increased numbers of fish in the future. However, there can be some direct, short-term negative economic effects as fewer fish could be available to harvest until the biomass of harvestable fish increases due to the decrease in the amount of time the species is open to harvest.

Implementing a spawning season closure and harvest prohibition for the recreational sector would be expected to reduce landings of greater amberjack in the short-term and, consequently, CS as well under **Preferred Alternative 2** in comparison to **Alternative 1 (No Action)**. The quantitative economic effects of this action may be at least partially captured in the economic effects described in Action 1 and Action 2 for recreational sector, since prohibiting harvest for the recreational sector would contribute to the reduction in landings that would need to occur. Thus, the quantitative effects are not necessarily additive to the effects shown in Action 1 and 2, but rather show the estimated economic effects of **Action 5** all other conditions remaining the same. **Preferred Alternative 2** is estimated to decrease net economic benefits by \$69,981 (2020 \$).

Action 6. Remove recreational annual catch targets from the Snapper Grouper Fishery Management Plan

A detailed analysis and discussion of the expected economic effects of the proposed action is included in Section 4.6.2. The following discussion summarizes the expected economic effects of the Council preferred alternative relative to the No Action alternative (i.e., the status quo). The purpose of ACTs is to help prevent a sector from exceeding its ACL due to management uncertainty. Exceeding an ACL would have direct negative economic effects on all sectors potentially due to a reduced stock size. If a species were closed too early for a sector based on the ACT, there would be direct negative economic effects as well because the sector was prohibited from harvesting fish. The ACTs covered by this action only apply to the recreational sector and are not currently tied to any AMs or other management measures; therefore, there are no expected economic effects associated with their removal. From a comparison of economic benefits perspective, **Preferred Alternative 2** would be neutral compared to **Alternative 1 (No Action)**.

B.5. Public Costs of Regulations

The preparation, implementation, enforcement, and monitoring of this or any federal action involves the expenditure of public and private resources, which can be expressed as costs associated with the regulations. Costs to the private sector are discussed in the effects of management measures. Estimated public costs associated with this action include:

South Atlantic Council costs of document preparation, meetings, public hearings, and information dissemination	\$64,329
NMFS administrative costs of document preparation, meetings, and review	\$51,472
TOTAL	\$115,802

The estimate provided above does not include any law enforcement costs. Any enforcement duties associated with this action would be expected to be covered under routine enforcement costs rather than an expenditure of new funds. The South Atlantic Council and NMFS administrative costs directly attributable to this amendment and the rulemaking process would be incurred prior to the effective date of the final rule implementing this amendment.

B.6. Net Benefits of Regulatory Action

It is important to specify the time period being considered when evaluating benefits and costs. According to OMB's FAQs regarding Circular A-4,²⁰ "When choosing the appropriate time horizon for estimating costs and benefits, agencies should consider how long the regulation being analyzed is likely to have resulting effects. The time horizon begins when the regulatory action is implemented and ends when those effects are expected to cease. Ideally, analysis should include all future costs and benefits. Here as elsewhere, however, a 'rule of reason' is appropriate, and the agency should consider for how long it can reasonably predict the future and limit its analysis to this time period. Thus, if a regulation has no predetermined sunset provision,

²⁰ See p. 4 at https://obamawhitehouse.archives.gov/sites/default/files/omb/assets/OMB/circulars/a004/a-4_FAQ.pdf

the agency will need to choose the endpoint of its analysis on the basis of a judgment about the foreseeable future.”

For current purposes, the reasonably “foreseeable future” is considered to be the next 5 years. There are two primary reasons for considering the next 5 years the appropriate time period for evaluating the benefits and costs of this regulatory action rather than a longer (or shorter) time period. First, this regulatory action does not include a predetermined sunset provision. Second, based on the history of management in the snapper grouper fishery in the South Atlantic, regulations such as those considered in this amendment are often revisited within 5 years or so.

The analyses of the changes in economic benefits indicates an increase of \$50,479 in net economic benefits to the recreational sector, an increase of \$199,628 in net economic benefits to the commercial sector, and an increase in total net economic benefits of \$250,107 (2020 \$) in the first year of implementation. These net benefits decline in subsequent years largely due to the declining annual catch limit for greater amberjack. In discounted terms and over a 5-year time period using the analyses provided in this amendment, the total net present value of the change in net economic benefits is -\$25,555 using a 7% discount rate and -\$58,183 using a 3% discount rate (2020 \$).

The estimated non-discounted public costs resulting from the regulation are \$115,802 (2020 \$). The costs resulting from the amendment and the associated rulemaking process should not be discounted as they will be incurred prior to the effective date of the final rule. Based on the quantified economic effects, this regulatory action is expected to increase net economic benefits to the Nation initially but then decrease net economic benefits in subsequent years. Over a 5-year time period, the quantified change in net economic benefits is expected to be -\$141,357 using a 7% discount rate and -\$173,985 using a 3% discount rate (2020 \$).

B.7. Determination of Significant Regulatory Action

Pursuant to E.O. 12866, a regulation is considered a “significant regulatory action” if it is likely to result in: 1) an annual effect of \$100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; 2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; 3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights or obligations of recipients thereof; or 4) raise novel legal or policy issues arising out of legal mandates, the President’s priorities, or the principles set forth in this executive order. Based on the information provided above, these actions have been determined to not be economically significant for the purposes of E.O. 12866. In absolute terms, the expected total costs and benefits of this amendment are \$250,107 in the first year of implementation.

Appendix C. Regulatory Flexibility Act Analysis

1. Introduction

The purpose of the Regulatory Flexibility Act (RFA) is to establish a principle of regulatory issuance that agencies shall endeavor, consistent with the objectives of the rule and of applicable statutes, to fit regulatory and informational requirements to the scale of businesses, organizations, and governmental jurisdictions subject to regulation. To achieve this principle, agencies are required to solicit and consider flexible regulatory proposals and to explain the rationale for their actions to assure such proposals are given serious consideration. The RFA does not contain any decision criteria; instead the purpose of the RFA is to inform the agency, as well as the public, of the expected economic impacts of various alternatives contained in the fishery management plan (FMP) or amendment (including framework management measures and other regulatory actions) and to ensure the agency considers alternatives that minimize the expected impacts while meeting the goals and objectives of the FMP and applicable statutes.

With certain exceptions, the RFA requires agencies to conduct an initial regulatory flexibility analysis (IRFA) for each proposed rule. The IRFA is designed to assess the impacts various regulatory alternatives would have on small entities, including small businesses, and to determine ways to minimize those impacts. An IRFA is primarily conducted to determine whether the proposed action would have a significant economic impact on a substantial number of small entities. The IRFA provides: 1) a description of the reasons why action by the agency is being considered; 2) a succinct statement of the objectives of, and legal basis for, the proposed rule; 3) a description and, where feasible, an estimate of the number of small entities to which the proposed rule will apply; 4) a description of the projected reporting, record-keeping, and other compliance requirements of the proposed rule, including an estimate of the classes of small entities which will be subject to the requirements of the report or record; 5) an identification, to the extent practicable, of all relevant federal rules, which may duplicate, overlap, or conflict with the proposed rule; 6) a description and estimate of the expected economic impacts on small entities; and 7) a description of the significant alternatives to the proposed rule and discussion of how the alternatives attempt to minimize economic impacts on small entities.

2. Statement of the need for, objective of, and legal basis for the proposed action

The need for and objective of this proposed action are provided in Chapter 1. In summary, there is a need to ensure catch limits are based on the best scientific information available and to ensure overfishing does not occur in the South Atlantic greater amberjack fishery, while increasing social and economic benefits through sustainable and profitable harvest of South Atlantic greater amberjack, consistent with the Magnuson-Stevens Fishery Conservation and Management Act (MSA) and its National Standards. There is also a need to make administrative efforts more efficient by removing recreational annual catch targets, which are not actively used in management, from the Snapper Grouper Fishery Management Plan. The objective of this proposed action is to revise the catch limits for greater amberjack in the South Atlantic based on the results of the latest stock assessment; revise sector allocations, minimum size limits, the

commercial trip limit, and the April spawning closure for greater amberjack; and remove recreational annual catch targets for the Snapper Grouper Fishery Management Plan. The MSA provides the statutory basis for this proposed action.

3. Description and estimate of the number of small entities to which the proposed action would apply

This proposed action, if implemented, would apply to all federally-permitted commercial vessels, federally-permitted charter vessels and headboats (for-hire vessels), and recreational anglers that fish for or harvest greater amberjack in Federal waters of the South Atlantic. It would not directly apply to federally-permitted dealers. Any change in the supply of greater amberjack available for purchase by dealers as a result of the proposed action, and associated economic effects, would be an indirect effect of the proposed rule and would therefore fall outside the scope of the RFA. Although it would apply to for-hire vessels, it would not be expected to have any direct effects on these entities. For-hire vessels sell fishing services to recreational anglers. The proposed changes to the greater amberjack management measures would not directly alter the services sold by these vessels. Any change in demand for these fishing services, and associated economic effects, as a result of this proposed action would be a consequence of a change in anglers' behavior, secondary to any direct effect on anglers and, therefore, an indirect effect of the proposed action. Because the effects on for-hire vessels would be indirect, they fall outside the scope of the RFA. For-hire captains and crew are permitted to retain greater amberjack under the recreational bag limit; however, they are not permitted to sell these fish. As such, for-hire captains and crew are only affected as recreational anglers. The RFA does not consider recreational anglers to be small entities, so they are also outside the scope of this analysis (5 U.S.C. 603). Small entities include small businesses, small organizations, and small governmental jurisdictions (5 U.S.C. 601(6) and 601(3)-(5)). Recreational anglers are not businesses, organizations, or governmental jurisdictions. In summary, only the impacts on commercial vessels will be discussed.

As of August 26, 2021, there were 579 valid or renewable²¹ South Atlantic Snapper Grouper unlimited permits and 112 valid or renewable 225-lb trip-limited permits. On average from 2015 through 2019, there were 242 federally-permitted commercial vessels with reported landings of greater amberjack in the South Atlantic. Their average annual vessel-level gross revenue from all species for 2015 through 2019 was \$68,449 (2020 dollars) and greater amberjack accounted for approximately 7% of this revenue. For commercial vessels that harvest greater amberjack in the South Atlantic, NMFS estimates that economic profits are approximately 4% of annual gross revenue, on average. The maximum annual revenue from all species reported by a single one of the vessels that harvested greater amberjack from 2015 through 2019 was approximately \$632,000 (2020 dollars).

For RFA purposes only, NMFS has established a small business size standard for businesses, including their affiliates, whose primary industry is commercial fishing (see 50 CFR § 200.2). A business primarily engaged in commercial fishing (NAICS code 11411) is classified as a small

²¹ A renewable permit is an expired limited access permit that cannot be actively fished, but can be renewed for up to one year after expiration.

business if it is independently owned and operated, is not dominant in its field of operation (including its affiliates), and has combined annual receipts not in excess of \$11 million for all its affiliated operations worldwide. All of the commercial fishing businesses directly regulated by this proposed action are believed to be small entities based on the NMFS size standard. No other small entities that would be directly affected by this proposed action have been identified.

4. Description of the projected reporting, record-keeping and other compliance requirements of the proposed action, including an estimate of the classes of small entities which will be subject to the requirement and the type of professional skills necessary for the preparation of the report or records

This proposed action would not establish any new reporting, record-keeping, or other compliance requirements.

5. Identification of all relevant federal rules, which may duplicate, overlap or conflict with the proposed action

No duplicative, overlapping, or conflicting federal rules have been identified.

6. Significance of economic impacts on a substantial number of small entities

Substantial number criterion

There are 691 federally permitted vessels eligible to commercially fish for or harvest greater amberjack in the South Atlantic. However, it is expected that those vessels that historically landed greater amberjack would be the most likely to be affected. From 2015 through 2019, there were 242 federally permitted commercial vessels, on average, that harvested and sold greater amberjack each year. Because all of these vessels are believed to be small entities, it is assumed that this action would affect a substantial number of small entities.

Significant economic impacts

The outcome of “significant economic impact” can be ascertained by examining two factors: disproportionality and profitability.

Disproportionality: Do the regulations place a substantial number of small entities at a significant competitive disadvantage to large entities?

All entities likely to be affected by this action are believed to be small entities and thus the issue of disproportionality does not arise.

Profitability: Do the regulations significantly reduce profits for a substantial number of small entities?

A detailed analysis of the economic effects associated with this proposed action can be found in Chapter 4. The following information summarizes the expected effects of this proposed action. Because this action is not expected to be implemented until 2023, the effects discussion focuses on the 2023/2024 fishing year and subsequent years.

This proposed action would modify the acceptable biological catch (ABC), annual catch limit (ACL), and optimum yield (OY) for greater amberjack, based on the most recent recommendation from the Scientific and Statistical Committee. The ACL and OY would be set equal to the ABC or 3,233,000 lbs ww in the 2023/2024 fishing year, 2,818,000 lbs ww in the 2024/2025 fishing year, 2,699,000 lbs ww in the 2025/2026 fishing year, and 2,669,000 lbs ww in the 2026/2027 and subsequent fishing years. Based on the current sector allocation percentages, the proposed action would represent an increase in the commercial sub-ACL for greater amberjack of 514,374 lbs ww in the 2023/2024 fishing year, 345,635 lbs ww in the 2024/2025 fishing year, 297,250 lbs ww in the 2025/2026 fishing year, and 285,052 lbs ww in the 2026/2027 and subsequent fishing years. However, as discussed below, this proposed action would also modify the percentage of the total ACL that is allocated to the commercial sector and therefore economic effects to small entities are quantified as part of that discussion.

This proposed action would decrease the commercial sector allocation from 40.66% of the total greater amberjack ACL to 35%. This, in conjunction with the proposed changes to the ACL schedule, would result in a commercial sub-ACL for greater amberjack of 1,088,029 lbs gw in the 2023/2024 fishing year, 948,365 lbs gw in the 2024/2025 fishing year, 908,317 lbs gw in the 2025/2026 fishing year, and 898,221 lbs gw in the 2026/2027 and subsequent fishing years. Relative to the status quo commercial ACL of 769,388 lbs gw, this would result in an increase in the commercial catch limit of 318,641 lbs gw in the 2023/2024 fishing year, 178,977 lbs gw in the 2024/2025 fishing year, 138,929 lbs gw in the 2025/2026 fishing year, and 128,833 lbs gw in the 2026/2027 and subsequent fishing years. If these increases in the ACL are fully harvested each year, it would result in an estimated increase in aggregate ex-vessel revenue of \$570,367 (2020 dollars) in the 2023/2024 fishing year, \$320,370 in the 2024/2025 fishing year, \$248,683 in the 2025/2026 fishing year, and \$230,611 in the 2026/2027 and subsequent fishing years. The average annual net present value of these potential increases in ex-vessel revenue over a five year timeframe, using discount rates of 3% and 7%, would be approximately \$306,000 (2020 dollars) and \$290,000, respectively. Divided by the average annual number of commercial vessels that harvested greater amberjack during 2015 through 2019, it would be an increase of \$1,266 or \$1,199 per vessel per year (approximately 1.8% of average annual per vessel gross revenue). It is important to note, however, that based on recent 5-year average commercial greater amberjack landings (2015/2016 through 2019/2020 fishing years), which are less than the existing ACL, these benefits might not materialize unless commercial effort targeting greater amberjack increases. Also, individual vessels may experience varying levels of economic effects, depending on their fishing practices, operating characteristics, and profit maximization strategies.

This proposed action would also decrease the commercial minimum size limit (MSL) from 36 inches fork length to 32 inches fork length. In general, a lower MSL would be expected to increase overall harvest in the short-term, thereby increasing economic benefits received from such harvest. Due to a lack of sufficient data related to the size of discarded fish, these economic benefits cannot be quantified. NMFS expects that this proposed change to the MSL would facilitate additional commercial harvest of greater amberjack, increasing the likelihood that the economic benefits of the overall increases to the commercial ACL are achieved.

In addition, the proposed action would increase the September 1 through the end of February (Season 2) commercial trip limit for greater amberjack from 1,000 lbs gw or ww to 1,200 lbs gw or ww. The March 1 through August 31 (Season 1) commercial trip limit, which currently is 1,200 lbs gw or ww, would not change. The proposed increase of 200 lbs gw or ww to the Season 2 commercial trip limit would be expected to increase aggregate annual landings by 45,980 lbs gw worth an estimated \$82,304 (2020 dollars) in aggregate ex-vessel revenue (approximately \$340 per vessel). These expected increases in landings and ex-vessel revenue would not be additive to the overall potential economic effects described for the changes to the commercial ACL above, but rather they represent short-term expectations based on current conditions and recent landings history.

Finally, the proposed action would revise the April spawning closure for greater amberjack such that during April each year, no person may sell, purchase, harvest, or possess a greater amberjack from the South Atlantic exclusive economic zone (EEZ) and the harvest and possession limits are zero. This closure would apply to both the recreational and commercial sectors. Because the current April spawning closure already prohibits the sale or purchase of greater amberjack harvested from the South Atlantic EEZ, this proposed change would only affect recreational anglers (including any commercial vessel operators or crew that harvest greater amberjack under the possession limit during the existing spawning closure). Again, recreational anglers are outside the scope of the RFA.

In summary, this proposed action would not be expected to have a significant economic impact on a substantial number of small entities.

7. Description of the significant alternatives to the proposed action and discussion of how the alternatives attempt to minimize economic impacts on small entities

This proposed action, if implemented, would not be expected to have a significant economic impact on a substantial number of small entities. As a result, the issue of significant alternatives is not relevant.

Appendix D. Essential Fish Habitat and Move to Ecosystem Based Management

I. EFH and EFH-HAPC Designations and Cooperative Habitat Policy Development and Protection

The Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) requires federal fishery management Councils and the National Marine Fisheries Service (NMFS) to designate essential fish habitat (EFH) for species managed under federal fishery management plans (FMP). Federal regulations that implement the EFH program encourage fishery management Councils and NMFS also to designate subsets of EFH to highlight priority areas within EFH for conservation and management. These subsets of EFH are called EFH-Habitat Areas of Particular Concern (EFH-HAPCs or HAPCs) and are designated based on ecological importance, susceptibility to human-induced environmental degradation, susceptibility to stress from development, or rarity of the habitat type. Information supporting EFH and EFH-HAPC designations was updated (pursuant to the EFH Final Rule) in Fishery Ecosystem Plan (FEP) II.

a. South Atlantic Council EFH User Guide

The [EFH Users Guide](#) developed during the FEP II development process is available through the FEP II Dashboard and provides a comprehensive list of the designations of EFH and EFH-HAPCs for all species managed by the South Atlantic Fishery Management Council (South Atlantic Council) and the clarifications identified during FEP II development. As noted above, additional detailed information supporting the EFH designations appears in FEP, FEP II, and in individual FMPs, and general information on the EFH provisions of the Magnuson-Stevens Act and its implementing regulations (50 CFR 900 [Subparts J](#) and [K](#)). These sources should be reviewed for information on the components of EFH assessments, steps to EFH consultations, and other aspects of EFH program operation.

b. South Atlantic Council EFH Policy and EFH Policy Statements

Policy for Protection and Restoration of EFH

South Atlantic Council Habitat and Environmental Protection Policy

In recognizing that species are dependent on the quantity and quality of their essential habitats, it is the policy of the South Atlantic Council to protect, restore, and develop habitats upon which fisheries species depend; to increase the extent of their distribution and abundance; and to improve their productive capacity for the benefit of present and future generations. For purposes of this policy, “habitat” is defined as the physical, chemical, and biological parameters that are necessary for continued productivity of the species that is being managed. The objectives of the South Atlantic Council policy will be accomplished through the recommendation of no net loss or significant environmental degradation of existing habitat. A long-term objective is to support and promote a net-gain of fisheries habitat through the restoration and rehabilitation of the productive capacity of habitats that have been degraded, and the creation and development of productive habitats where increased fishery production is probable. The South Atlantic Council will pursue these goals at state, Federal, and local levels. The South Atlantic Council shall assume an aggressive role in the protection and enhancement of habitats important to fishery species and shall

actively enter Federal decision-making processes where proposed actions may otherwise compromise the productivity of fishery resources of concern to the South Atlantic Council.

South Atlantic Council EFH Policy Statements

Considerations to Reduce or Eliminate the Impacts of Non-Fishing Activities on EFH

In addition to implementing regulations to protect habitat from degradation due to fishing activities, the South Atlantic Council in cooperation with NMFS, actively comments on non-fishing projects or policies that may impact fish habitat. The South Atlantic Council established a Habitat Protection and Ecosystem Based Management Advisory Panel (AP) and adopted a comment and policy development process. Members of the AP serve as the South Atlantic Council's habitat contacts and professionals in the field and have guided the South Atlantic Council's development of the following Policy Statements:

- [EFH Policy Statement on South Atlantic Climate Variability and Fisheries \(December 2016\)](#)
- [EFH Policy Statement on South Atlantic Food Webs and Connectivity \(December 2016\)](#)
- [Protection and Restoration of EFH from Marine Aquaculture \(June 2014\)](#)
- [Protection and Enhancement of Marine Submerged Aquatic Vegetation \(June 2014\)](#)
- [Protection and Restoration of EFH from Beach Dredging and Filling, Beach Re-nourishment and Large Scale Coastal Engineering \(March 2015\)](#)
- [Protection and Restoration of EFH from Energy Exploration, Development, Transportation and Hydropower Re-Licensing \(December 2015\)](#)
- [Protection and Restoration of EFH from Alterations to Riverine, Estuarine and Nearshore Flows \(June 2014\)](#)
- [Policies for the Protection of South Atlantic Marine & Estuarine Ecosystems from Non-Native and Invasive Species \(June 2014\)](#)
- [Policy Considerations for Development of Artificial Reefs in the South Atlantic Region and Protection of Essential Fish Habitat \(September 2017\)](#)

II. Habitat Conservation and Fishery Ecosystem Plans

The South Atlantic Council, views habitat conservation as the foundation in the move to Ecosystem Based Fishery Management (EBFM) in the region. The South Atlantic Council has been proactive in advancing habitat conservation through extensive gear restrictions in all South Atlantic Council FMPs and by directly managing habitat and fisheries affecting those habitats through two FMPs, the [FMP for Coral, Coral Reefs and Live/Hard Bottom Habitat of the South Atlantic Region](#) (Coral FMP) and the [FMP for the Sargassum Fishery of the South Atlantic Region](#). The FMP for the Dolphin and Wahoo Fishery in the Atlantic represents a proactive FMP which established fishery measures and identified EFH in advance of overfishing or habitat impacts from the fisheries.

Building on the long-term conservation approach, the South Atlantic Council facilitated the evolution of the Habitat Plan into the first FEP to provide a clear description and understanding of the fundamental physical, biological, and human/institutional context of ecosystems within which fisheries are managed and identify information needed and how that information should be used in the context of FMPs. Developing a South Atlantic FEP required a greater understanding of the South Atlantic ecosystem, including both the complex relationships among humans, marine life, the environment and essential fish habitat and a more comprehensive understanding of the biological, social, and economic impacts of management necessary to initiate the transition from single species management to EBFM in the region. To support the

move towards EBFM, the South Atlantic Council adopted broad goals: (1) maintaining or improving ecosystem structure and function; (2) maintaining or improving economic, (3) social, and cultural benefits from resources; and (4) maintaining or improving biological, economic, and cultural diversity.

III. Ecosystem Approach to Conservation and Management of Deep-water Ecosystems

Through [Comprehensive Ecosystem-Based Amendment 1](#), [Comprehensive Ecosystem-Based Amendment 2](#), and [Coral Amendment 8](#), the South Atlantic Council established and expanded deep-water coral HAPCs (CHAPCs) and co-designated them as EFH-HAPCs to protect the largest continuous distribution (>23,000 square miles) of pristine deep-water coral ecosystems in the world from fishing and non-fishing activities.

IV. FEP II Development

The South Atlantic Council developed FEP II in cooperation with NMFS, as a mechanism to incorporate ecosystem principles, goals, and policies into the fishery management process, including consideration of potential indirect effects of fisheries on food web linkages when developing harvest strategies and management plans. South Atlantic Council policies developed through the process support data collection, model and supporting tool development, and implementation of FEP II. FEP II and the FEP II Implementation Plan provide a system to incorporate of ecosystem considerations into the management process.

FEP II was developed employing writing and review teams established from the South Atlantic Council's Habitat Protection and Ecosystem Based Management AP, and experts from state, federal, NGOs, academia and other regional organizations and associations. Unlike the original Plan, FEP II is a living continually developing online information system presenting core sections and sections with links to documents or other online systems with detailed updated information on species, habitat, fisheries and research. A core part of the FEP II development process involved engaging the South Atlantic Council's Habitat Protection and Ecosystem Based Management AP and regional experts in developing new sections and ecosystem- specific policy statements to address South Atlantic food webs and connectivity and South Atlantic climate variability and fisheries. In addition, standing essential fish habitat policy statements were updated and a new artificial reef habitat policy statement was approved. In combination, these statements advance habitat conservation and the move to EBFM in the region. They also serve as the basis for further policy development, consideration in habitat and fish stock assessments and future management of fisheries and habitat. They also support a more comprehensive view of conservation and management in the South Atlantic and identify long-term information needs, available models, tools, and capabilities that will advance EBFM in the region.

FEP II Dashboard (In transition to new Habitat and Ecosystem Page)

The FEP II Dashboard and associated online tools provided a clear description of the fundamental physical, biological, human, and institutional context of South Atlantic ecosystems within which fisheries are managed. The Council’s new website (under development) will include a new Habitat and Ecosystem page where the FEP II Dashboard layout shown below will be refined and integrated.

- Introduction
- South Atlantic Ecosystem
- South Atlantic Habitats
- Managed Species
- Social and Economic
- Essential Fish Habitat
- SAFMC Managed Areas
- Research & Monitoring
- SAFMC Tools

V. NOAA EBFM Activities Supporting FEP II

a. *NOAA EBFM Policy and Road Map*

To support the move to EBFM, NMFS developed an agency-wide EBFM Policy and Road Map (available through Ecosystem page (under revision) of the FEP II Dashboard that outlines a set of principles to guide actions and decisions over the long-term to: implement ecosystem-level planning; advance our understanding of ecosystem processes; prioritize vulnerabilities and risks of ecosystems and their components; explore and address trade-offs within an ecosystem; incorporate ecosystem considerations into management advice; and maintain resilient ecosystems.

b. *FEP II Implementation Plan Structure and Framework*

The Implementation Plan is structured to translate approved policy statements of the South Atlantic Council into actionable items. The plan encompasses chapters beginning with an introduction to the policy statement, a link to the complete policy statement, and a table which translates policies and policy components into potential action items. The actions within the plan are recommendations for activities that could support the South Atlantic Council’s FEP II policies and objectives.

c. *FEP II Two Year Roadmap*

The FEP II Two Year Roadmap draws from the Implementation Plan and presents three to five priority actions for each of the nine approved policy statements of the South Atlantic Council which would be initiated or completed over the next two years (2019-2020). The Roadmap provides “Potential Partners” and other potential regional collaborators, a focused list of priority actions they could cooperate with the South Atlantic Council on to advance policies supporting the move to EBFM in the South Atlantic region.

d. *Monitoring/Revisions to FEP II Implementation Plan*

FEP II and this supporting Implementation Plan are considered active and living documents. The Implementation Plan will be reviewed and updated periodically. During their spring meeting in 2021 and every three years following, the Habitat Protection and Ecosystem Based Management AP will engage regional experts as needed, to determine whether additional actions addressing council policies should be added to the implementation plan. The South Atlantic Council’s Habitat Protection and Ecosystem Based Management Committee will review, revise and refine those recommendations for South Atlantic Council consideration and approval for inclusion into the implementation plan.

VI. Regional Habitat and Ecosystem Partners

The South Atlantic Council, with the Habitat Protection and Ecosystem Based Management AP as the foundation, collaborates with regional partners to create a comprehensive habitat and ecosystem network in the region to enhance habitat conservation and EBFM.

Detailed information and links to partners are highlighted online:

https://ocean.floridamarine.org/safmc_dashboard/partners.html.

VII. Regional Ecosystem Modeling in the South Atlantic

a. *South Atlantic Ecopath with Ecosim Model*

The South Atlantic Council worked cooperatively with the University of British Columbia and the Sea Around Us project to develop a straw-man and preliminary food web models (Ecopath with Ecosim) to characterize the ecological relationships of South Atlantic species, including those managed by the South Atlantic Council. This effort helped the South Atlantic Council and cooperators identify available information and data gaps while providing insight into ecosystem function. More importantly, the model development process provided a vehicle to identify research necessary to better define populations, fisheries, and their interrelationships. While individual efforts were underway in the South Atlantic, only with significant investment of resources through other programs was a comprehensive regional model further developed.

The current South Atlantic EwE model provides a more complete view of the system and supports potential future evaluations that may be possible with the model. With the model complete and tuned to the available data it can be used to address broad strategic issues and explore “what if” scenarios that could then be used to address tactical decision-making questions such as provide ecosystem context for single species management, address species assemblage questions, and address spatial questions using Ecospace.

A modeling team comprised of FWRI staff, South Atlantic Council staff and other technical experts as needed, will coordinate with members of the original Ecosystem Modeling Workgroup to maintain and further refine the South Atlantic Model.

The Council convened a working group to provide guidance on application of the Ecopath with Ecosim model framework to investigate potential impacts of increased red snapper recruitment on other species in the snapper grouper complex broader South Atlantic Ecosystem. The Working group met in August 2021 to review the model and provide guidance on further development and in September 2021 to review findings and prepare a report for SSC consideration. Results were presented to the SSC in October 2021.

VIII. Tools supporting Habitat Conservation and EBFM in the South Atlantic Region

The South Atlantic Council developed a Habitat Conservation and Ecosystem Management Section which provided access to the FEP II Digital Dashboard and associated tools which is under development with the new website. Florida's FWRI maintains and distributes GIS data, imagery, and documents relevant to habitat conservation and ecosystem-based fishery management in their jurisdiction. Web Services and spatial representations of EFH and other habitat related layers are accessible through the Council's [SAFMC Atlas](#), a platform for searching and visualizing GIS data relevant to the Council's mission and download of GIS layers and information on regional partners is available through the [SAFMC Digital Dashboard](#). The online systems provide access to the following Services:

- i. [South Atlantic Fisheries Webservice](#): Provides access to species distribution and spatial presentation of regional fishery independent data from the Southeast Area Monitoring and Assessment Program (South Atlantic) SEAMAP-SA, the Marine Resources Monitoring, Assessment, and Prediction program (MARMAP), and NOAA Southeast Fishery-Independent Survey (SEFIS).
- ii. [South Atlantic EFH Webservice](#): Provides access to spatial representation of EFH and EFH-HAPCs for South Atlantic Council-managed species and Highly Migratory Species.
- iii. [South Atlantic Managed Areas Service](#): Provides access to spatial presentations of South Atlantic Council and other managed areas in the region.
- iv. [South Atlantic Artificial Reefs Web Application](#): Provides a regional view of artificial reefs locations, contents and imagery associated with programs in the southeastern U.S. overseen by individual states (Florida, Georgia, South Carolina, North Carolina).
- v. South Atlantic [ACCSP Web Map](#) and [Application](#): The web map displays Atlantic Coastal Cooperative Statistics Program (ACCSP) Statistical Areas representing catch and values of Council-managed species across time with the application displaying charts of landings and values for ACCSP Statistical Areas.

IX. Ecosystem-Based Action, Future Challenges and Needs

One of the greatest challenges to enhance habitat conservation and EBFM in the region is funding high priority research, including comprehensive benthic mapping and ecosystem model and management tool development. In addition, collecting detailed information on fishing fleet dynamics including defining fishing operation areas by species, species complex, and season, as well as catch relative to habitat is critical for assessment of fishery, community, and habitat impacts and for South Atlantic Council use in place-based management measures. Additional resources need to be dedicated to expanding regional coordination of modeling, mapping, characterization of species use of habitats, and full funding of regional fishery independent surveys (e.g., MARMAP, SEAMAP, and SEFIS) which are linking directly to addressing high priority management needs. The FEP II Implementation Plan includes Appendix A to highlight research and data needs excerpted from the [SEAMAP 5 Year Plan](#) because they represent short and long-term research and data needs that support EBFM and habitat conservation in the South Atlantic Region.

Development of ecosystem information systems to support South Atlantic Council management should build on existing tools (e.g., Regional Habitat and Ecosystem GIS and Arc Services) and provide resources to regional cooperating partners for expansion to address long-term South

DRAFT DOCUMENT

Atlantic Council needs. NOAA should support and build on the regional coordination efforts of the South Atlantic Council as it transitions to a broader management approach. Resources need to be provided to collect information necessary to update information supporting FEP II, which support refinement of EFH designations and spatial representations and future EBFM actions. These are the highest priority needs to support habitat conservation and EBFM, the completion of mapping of near-shore, mid-shelf, shelf edge, and deep-water habitats in the South Atlantic region and refinement in the characterization of species use of habitats.

Appendix E. Alternatives considered but eliminated from detailed analysis

Action 1. Revise the greater amberjack acceptable biological catch, total annual catch limit, and annual optimum yield

Alternative 5. Revise the total annual catch limit and annual optimum yield for greater amberjack. For the 2022/2023 season through the 2024/2025 season, set the total annual catch limit and annual optimum yield equal to the middle value of the updated acceptable biological catch projected for 2022/2027. For the 2025/2026 season through the 2026/2027 season, set the total annual catch limit and annual optimum yield equal to the updated acceptable biological catch. The 2026/2027 total annual catch limit and annual optimum yield would remain in place until modified.

Fishing Year	Total ACL (lbs ww)
2022/2023	2,818,000
2023/2024	2,818,000
2024/2025	2,818,000
2025/2026	2,699,000
2026/2027+	2,669,000

Discussion: The Council noted that the total ACLs proposed in this alternative would not take advantage of potential increased fishing opportunities following the SEDAR 59 (2020) stock assessment indicating South Atlantic greater amberjack are not overfished and not experiencing overfishing. This alternative was removed to allow staff more time to analyze effects of other actions and alternatives considered in this amendment.

Action 3. Increase the recreational minimum size limit for greater amberjack

Preferred Alternative 1 (No Action). The recreational minimum size limit is 28 inches fork length.

Alternative 2. Increase the recreational minimum size limit to 30 inches fork length.

Alternative 3. Increase the recreational minimum size limit to 32 inches fork length.

Alternative 4. Increase the recreational minimum size limit to 36 inches fork length.

Discussion: Based on the sexual maturity schedule from SEDAR 59 (2020), 89% of female greater amberjack are mature by 2 years old (25 inches fork length) and 99% are mature by 3 years old (29.1 inches fork length). Given the high percentage of maturity at the current recreational minimum size limit (28 inches fork length) and a lack of strong public desire to

DRAFT DOCUMENT

increase the recreational size limit, the Council determined that further consideration of revising this limit was not needed at this time.

Appendix F. Data Analyses

F.1. Recreational Sector Analyses

The South Atlantic Fishery Management Council's Snapper-Grouper Amendment 49 (Amendment 49) is considering changes to management regulations for the greater amberjack stock. Amendment 49 is considering changes to the recreational sector's Annual Catch Limit (ACL) in Action 2, minimum size limit in Action 3 (removed from consideration and moved to Appendix E), and closing the recreational sector in April in Action 6.

Predicting Recreational Landings

Recreational landings data for South Atlantic greater amberjack were obtained from the Southeast Fisheries Science Center (SEFSC) on September 1, 2021. The current ACL is being tracked using Marine Recreational Fisheries Statistics Survey (MRFSS) equivalent landings. However, this analysis uses Marine Recreational Informational Program (MRIP) Fishing Effort Survey (FES) data to match the same currency (MRIP FES) as the most recent South Atlantic greater amberjack assessment (SEDAR 59). The data also contains landing from the Southeast Regional Headboat Survey (Headboat). Recreational landings are collected and organized in two-month increments called waves (e.g., January and February = wave 1, March and April = wave 2, etc.).

Future recreational landings were determined from reviewing recent recreational landings data. The greater amberjack recreational fishing year is from March 1 of one year then goes to February 28 in the following year. The most recent complete five years of data are from the fishing years of 2016/2017 to 2020/2021. These data were used to generate three potential future recreational landings scenarios: 1) three year average of the most recent years of complete data (2018/2019, 2019/2020, and 2020/2021), 2) five year average of the most recent years of complete data (2016/2017 through 2020/2021), and 3) the maximum landings in the last five years of complete data. The year with the maximum landings in the last five years is the 2016/2017 fishing year. Due to closures in the 2016/2017 fishing year (closed on November 30, 2016) and the 2017/2018 fishing year (closed on October 31, 2017) both landings for scenario 2 and also scenario 3 used the three-year average landings for the November/December and January/February time periods. Table F-1 and Figure F-1 displays the recreational landings used in this analysis.

Table F-1. South Atlantic greater amberjack recreational landings by two-month wave for the 2016/2017 to the 2020/2021 fishing years, and the three-year and five-year average. Landings are in pounds whole weight (lbs ww). The fishing years of 2016/2017 and 2017/2018 are not for the full fishing year because these fishing years had recreational closures.

Year	Mar/Apr	May/Jun	Jul/Aug	Sep/Oct	Nov/Dec	Jan/Feb
2016/2017	218,494	1,260,300	1,081,108	146,990	13,598	52,687
2017/2018	414,724	549,491	348,614	63,001	557,744	4,932
2018/2019	72,375	423,071	197,117	24,854	157,905	239,948
2019/2020	305,184	448,312	549,661	2,645	69,054	153,546
2020/2021	55,621	477,888	269,632	78,105	50,159	59,924
3 Year average	144,393	449,757	338,803	35,201	92,373	151,139
5 year average	213,280	631,812	489,226	63,119	92,373	151,139

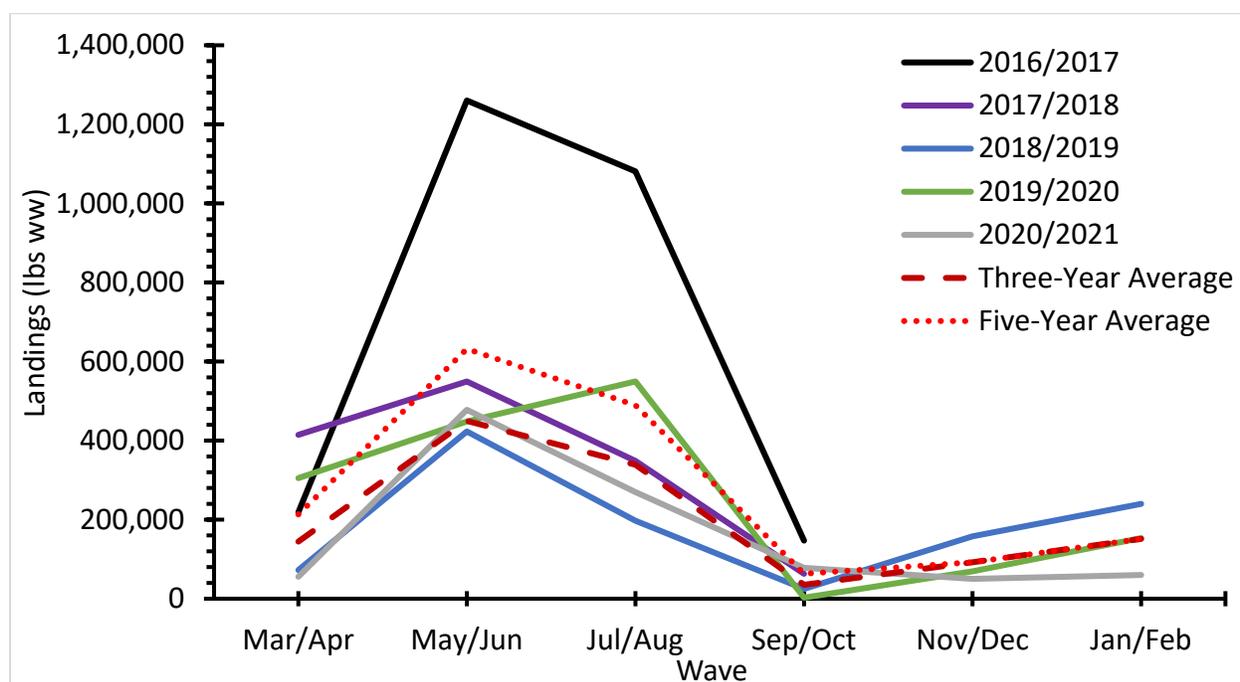

Figure F-1. South Atlantic greater amberjack recreational landings by two-month wave for the 2016/2017 to the 2020/2021 fishing years, and the three-year and five-year average. Landings are in ww. The fishing years of 2016/2017 and 2017/2018 are not for the full fishing year because these fishing years had recreational closures.

Action 2 of Amendment 49 is considering a range of recreational ACLs with different ACLs for each Amendment alternative and each fishing year. To simplify the analysis, only the lowest, middle, and highest ACLs for each Alternative of Action 2 was included in the analysis. Season lengths were projected by cumulatively summing the recreational landings for the three landings scenarios, and compare the results to the range of recreational ACL options in Action 2 of Amendment 49. Table F-2 provides the predicted closure dates for the recreational sector. The predicted closure dates span from May 5 to no closure needed. No closure dates were needed for landings scenario 1 because the three-year average of the recreational landings generated

landings below all of the recreational ACLs provided in Action 2. Landings scenario 2 resulted in only one closure date. Landings scenario 3 resulted in a range of closure dates.

Table F-2. The projected closure dates for the greater amberjack recreational sector for a range of recreational ACLs from Action 1. The closure dates were generated from the three different landings scenarios of 1) three-year average of the most recent years of complete data (2018/2019 through 2020/2021), 2) five-year average of the most recent years of complete data (2016/2017 through 2020/2021), and 3) the maximum landings in the last five years of complete data.

Impact from Increasing the Recreational Minimum Size Limit

Note: Action 3 of Amendment 49 was moved to the Alternatives Considered But Eliminated from Detailed Analysis (Appendix E).

Action 3 considered an increase to the recreational minimum size limit. The current minimum size limit is 28 inches fork length, and Action 3 considered increasing the minimum size limit to 30, 32, and 36 inches fork length. Available lengths of South Atlantic greater amberjack harvested in the recreational sector in recent years (2015 through 2020) are available from MRIP and Headboat. In August 2021, MRIP harvested fish lengths were downloaded from the website of www.fisheries.noaa.gov, and Headboat harvested fish lengths were provided from the SEFSC. The harvested fish lengths are shown in Figure F-2.

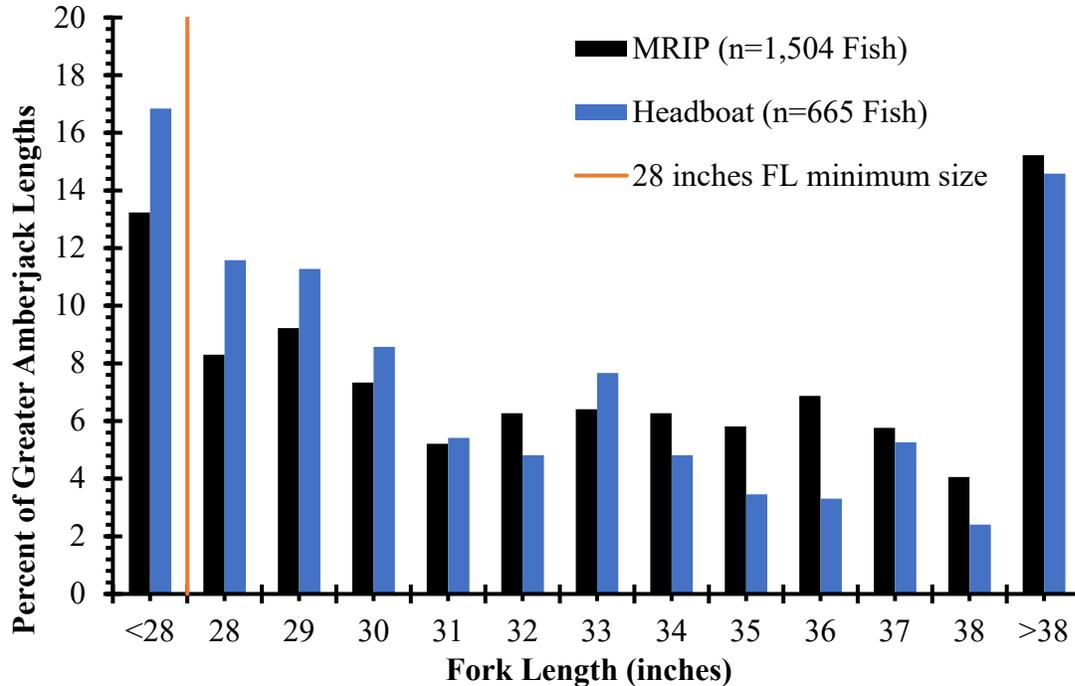

Figure F-2. Percent of south Atlantic greater amberjack fork lengths in the recreational sector in 1-inch fork length increments by dataset. The orange line represents the current recreational minimum size limit. Length data came from MRIP and Headboat harvested fish. All of the data came from 2015 through 2020.

The harvested lengths also had weight data for each fish. Percent reductions in harvest weight were calculated for the different Action 3 minimum size limits as follows:

Percent reduction = $((C - G) - B)/C$, where:

C = catch in pounds whole weight

G = weight of fish that are greater than or equal to the minimum size limit being considered

B = weight of fish smaller than the 28-inch minimum size limit

Percent reductions associated with minimum size limit were normalized to a 0% reduction at the commercial status quo of 28 inches fork length. Length data from 2015 to 2020 were used for the size limit analysis. Table F-3 provides the calculated percent reduction in landings.

Table F-3. Calculated percent reduction in recreational landings for the different Action 3 recreational size limit alternatives using the recent recreational data (2015-2020). The results are separated by the different recreational datasets (MRIP and Headboat).

Alternative	Size Limit (Inches FL)	MRIP Reduction (%)	Headboat Reduction (%)
1	28	0	0
2	30	7.4	13.0
3	32	14.4	22.5
4	36	34.9	40.2

Since this South Atlantic analysis used two different datasets (MRIP and Headboat) the percent reductions were simplified by weighting the impact of the percent reductions by each datasets contribution to the total South Atlantic greater amberjack landings. Using the 2015 to 2020 landings data the contribution of the total landings by dataset are shown in Table F-4. The simplified weighted percent reductions are shown in Table F-5.

Table F-4. Percent contribution of the total South Atlantic greater amberjack recreational landings by each dataset. These estimates were generated from the 2015 to 2020 South Atlantic greater amberjack recreational landings.

Dataset	Percentage of Total Landings
MRIP	96.6%
Headboat	3.4%

Table F-5. Calculated percent reductions of the total South Atlantic greater amberjack landings for each of the Amendment 49 Action 3 alternatives. The reductions by dataset from Table F-3 were weighted by the percent of total landings from Table F-4.

Alternative	Size Limit (Inches FL)	Weighted Percent Reduction (%)
1	28	0.0
2	30	7.6
3	32	14.7
4	36	35.1

The reduction in landings from increasing the recreational minimum length to 30, 32, and 36 inches fork length were applied to the three recreational landings scenarios. The reduction from increasing the minimum size limit resulted in longer seasons. Table 5 provides the estimated closure dates from the increase in the minimum size limit. This resulted in closures from July 5 to having the recreational sector open a full 12 months.

Table F-6. The projected closure dates for greater amberjack for a range of recreational ACLs from Action 1 with three different landings scenarios combined with increased minimum size length of 30, 32, and 36 inches fork length from Action 3. Closure dates for the Action 3 Alternative 1 minimum size limit of 28 inches are provided in Table 1 since this is the current minimum size limit, and assumes no change to the minimum size limit. The three different recreational landings scenarios are 1) three-year average of the most recent years of complete data (2018/2019 through 2020/2021), 2) five-year average of the most recent years of complete data (2016/2017 through 2020/2021), and 3) the maximum landings in the last five years of complete data.

Impact from Closing the Recreational Sector in April

Amendment 49 Action 6 considers closing the recreational sector by not allowing any harvest or possession of greater amberjack in the month of April. This April closure was analyzed by assuming the April recreational landings were zero. The recreational landings are collected in two-month waves and the March/April wave of landings were separated into each month by assuming uniform landings within the March/April wave, and dividing by the number of days each month contributed to the March/April wave. Following the three recreational landing scenarios the predicted April landings are provided in Table F-7. Assuming the April landings are zero the predicted closure dates are shown in Table F-8. The closure dates ranged from July 2 to having the recreational sector open a full 12 months.

Table F-7. The projected recreational landings in April for the three landings scenarios. The three different recreational landings scenarios are 1) three-year average of the most recent years of complete data (2018/2019 through 2020/2021), 2) five-year average of the most recent years of complete data (2016/2017 through 2020/2021), and 3) the maximum landings in the last five years of complete data. Landings are in lbs ww.

Landings Scenario	Predicted April Landings
3 Year average	71,013
5 year average	104,892
Max	107,456

Table F-8. The projected closure dates for greater amberjack for a range of recreational ACLs from Action 1 with three different landings scenarios and a closure of the recreational sector in April. The three different recreational landings scenarios are 1) three-year average of the most recent years of complete data (2018/2019 through 2020/2021), 2) five-year average of the most recent years of complete data (2016/2017 through 2020/2021), and 3) the maximum landings in the last five years of complete data.

Alternative	Year	Recreational ACL	Scenario 1	Scenario 2	Scenario 3
			Closure Date	Closure Date	Closure Date

	2026/2027	1,334,500	None	None	2-Jul

Combining the Increased Minimum Size Limit with the April closure

Closure dates were projected from combining the reduction in landings from increasing the minimum size limit with the April closure for the three landings scenarios. This resulted in a range of closure dates from as early as July 8 to no closure (Table F-9).

Table F-9. The projected closure dates for greater amberjack for a range of recreational ACLs from Action 1 with three different landings scenarios combined with increased minimum size length of 30, 32, and 36 inches fork length from Action 3 with the Action 6 April closure. The three different recreational landings scenarios are 1) three-year average of the most recent years of complete data (2018/2019 through 2020/2021), 2) five-year average of the most recent years of complete data (2016/2017 through 2020/2021), and 3) the maximum landings in the last five years of complete data.

F.2. Commercial Sector Analyses

The South Atlantic Fishery Management Council’s Snapper-Grouper Amendment 49 (Amendment 49) is considering changes to management regulations for the greater amberjack stock. Amendment 49 is considering changes to the commercial sector’s Annual Catch Limit (ACL) in Action 2, minimum size limit in Action 4, increasing the commercial trip limit in Action 5, and allow commercial harvest of greater amberjack in April in Action 6. The South Atlantic greater amberjack commercial sector is separated into two fishing seasons: 1) March 1 through August 31 (season 1) and 2) September 1 through February 28 (season 2). This amendment analysis was written with all of the season 1 information located together in the beginning of the report, and then all of the season 2 information is located together at the end of the report.

Season 1: March 1 through August 31

Predicting Commercial Landings

Commercial landings data for South Atlantic greater amberjack were obtained from the Southeast Fisheries Science Center (SEFSC) on September 29, 2021. All of the South Atlantic greater amberjack commercial landings are in lbs gutted weight (gw). Future commercial landings were determined from reviewing recent commercial landings data. The greater amberjack commercial season 1 is from March 1 through August 31. The most recent five years of complete data are from the fishing years of 2016 through 2020. These data were used to

generate three potential future commercial landings scenarios: 1) three year average of the most recent years of complete data (2018, 2019, and 2020), 2) five year average of the most recent years of complete data (2016 through 2020), and 3) the maximum landings in the last five years of complete data. The year with the maximum commercial landings in season 1 in the last five years is 2017. The commercial landings in lbs gw in Table F-10 and Figure F-3 displays the season 1 commercial landings used in this analysis.

Table F-10. South Atlantic greater amberjack commercial landings by month for season 1 from 2016 to 2020, three-year average, and five-year average, in lbs gw. Season 1 is from March through August.

Year	March	April	May	June	July	August
2016	167,607	675	229,197	114,224	74,738	79,716
2017	149,077	204,985	260,893	126,080	82,499	74,743
2018	103,677	628	167,351	84,347	40,948	52,021
2019	55,903	651	126,707	36,247	22,474	43,455
2020	48,580	752	58,488	46,170	61,963	45,314
3 year average	69,387	93,451	117,515	55,588	41,795	46,930
5 year average	104,969	136,748	168,527	81,414	56,525	59,050

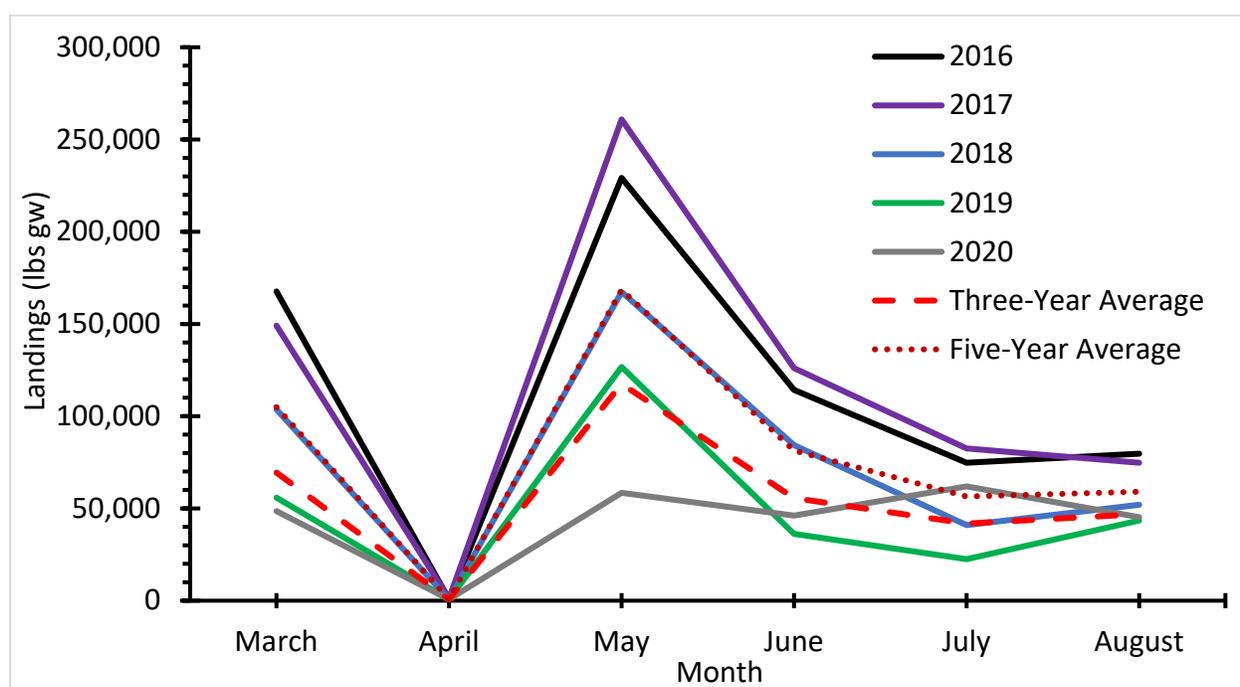

Figure F-3. South Atlantic greater amberjack commercial landings by month for season 1 from 2016 to 2020, three-year average, and five-year average, in lbs gw. Season 1 is from March through August.

Action 2 of Amendment 49 considers a range of commercial ACLs for season 1 with different ACLs for each Alternative and year. Season length analysis was conducted for all three Action 2 alternatives. To simplify the analysis, only the preferred alternative (Alternative 3 of Action 2)

was analyzed for the other Actions relating to the commercial season 1. Additionally, since Alternative 1 provides a range of five different ACLs, only the lowest, middle, and highest ACLs were included in the analysis. Season lengths were projected by cumulatively summing the commercial landings for the three landings scenarios, and compare the results to the lowest, middle, and highest Action 2 Alternative 1 commercial season 1 ACL options. Predicted closure dates were determined when the landings reached the ACL (Table F-11). There were no closure dates needed for landings scenario 1 and 2 because these landings were below all of the Alternative 1 season 1 commercial ACLs provided in Action 2. Scenario 3 had predicted closure dates span from June 12 to no closure needed.

Table F-11. The projected closure dates for the greater amberjack season 1 commercial sector for a range of commercial ACLs from Action 1. The closure dates were generated from the three different landings scenarios of 1) three-year average of the most recent years of complete data, 2) five-year average of the most recent years of complete data, and 3) the maximum landings in the last five years of complete data.

Alternative	Year	Commercial ACL Season 1	Scenario 1	Scenario 2	Scenario 3
			Closure Date	Closure Date	Closure Date

Impact from Decreasing the Commercial Minimum Size Limit in Season 1

Action 4 of Amendment 49 considers a decrease to the commercial minimum size limit. The current commercial minimum size limit is 36 inches fork length, and Action 4 considers decreasing the commercial minimum size limit to 34, 32, 30, and 28 inches fork length. Harvest datasets were not useful for this analysis since it is illegal to harvest greater amberjack below the minimum size limit. Therefore, the current minimum size limit regulation results in dockside commercial harvest surveys collecting very little length data for greater amberjack below the minimum size limit. However, observer data has length information for released fish, and observer data were provided from the SEFSC on October 12, 2021. The commercial observer

program started in the South Atlantic region in 2008 with a voluntary program where captains could volunteer to have an observer on their boat. This changed in 2014 where observer coverage was made mandatory. However, the South Atlantic observer data program only sampled a small proportion of the commercial fleet and greater amberjack data are only available for the years of 2018, 2019, and 2020. The commercial observer program produced lengths from 38 released greater amberjack in the South Atlantic region. These lengths were plotted in Figure F-4. Due to the relatively small number of lengths available for discarded South Atlantic greater amberjack the data were not separated into season 1 and season 2.

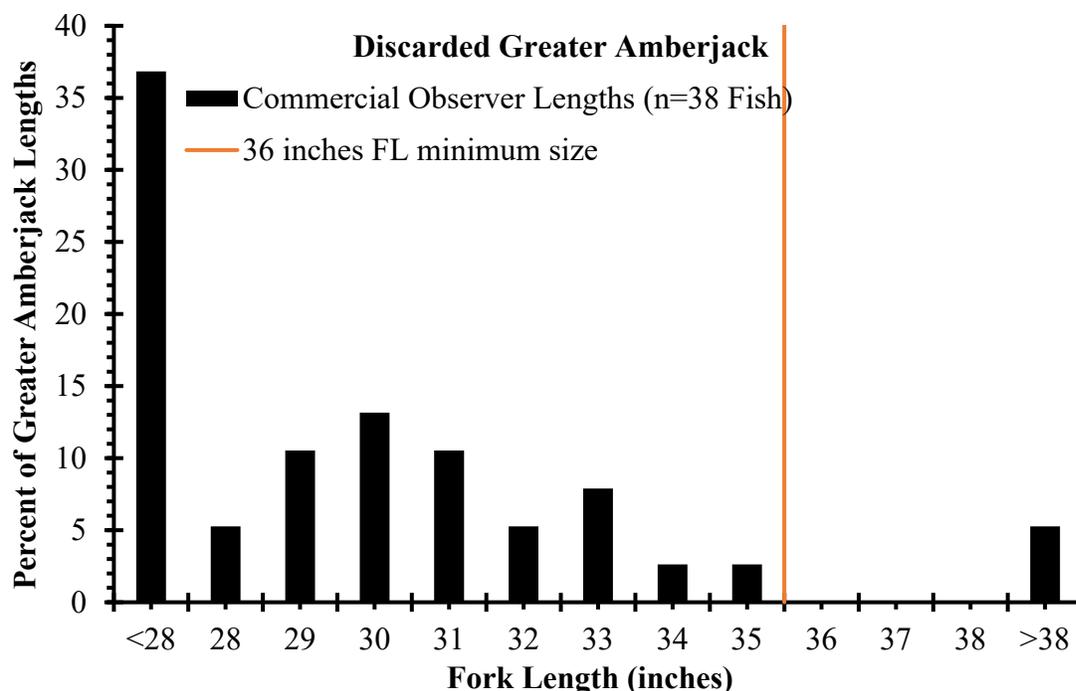

Figure F-4. Percent of south Atlantic greater amberjack lengths from released fish in the commercial sector. The data were plotted in 1-inch length increments, and the length data are in fork length. The data came from the commercial observer program which had limited greater amberjack observer data. All of the data came from 2018 through 2020. The orange line represents the current commercial minimum size limit of 36 inches fork length.

Reliable estimates of percent increases in harvest from decreasing the minimum size limit are not possible because of two factors: 1) low number of available data on discarded greater amberjack lengths, and, 2) not having a reliable estimate of the proportion of discards to the total South Atlantic greater amberjack commercial catch. The commercial observer program started in the South Atlantic region in 2008 with a voluntary program where captains could volunteer to have an observer on their boat. This changed in 2014 where observer coverage was made mandatory. However, the South Atlantic observer data program only sampled a small proportion of the commercial fleet and greater amberjack data are only available for the years of 2018, 2019, and 2020. Therefore, making an assumption on greater amberjack discards compared to the total commercial catch would likely be erroneous. Instead the lengths shown in Figure F-4 can likely only be used for qualitative analysis instead of quantitative analysis. In summary, length data on

released greater amberjack is limited. Reducing the minimum size limit will allow harvest of smaller greater amberjack and will likely increase harvest.

Impact from Increasing the Trip Limit for Season 1

Action 5 of Amendment 49 considers increasing the commercial trip limit in season 1. Commercial logbook data provides the lbs harvested per trip, and commercial logbook data were provided from the SEFSC on May 2, 2021. The current trip limit is 1,200 lbs and Action 5 is considering increasing the season 1 trip limit to 1500, 2000, and 2500 lbs. The greater amberjack commercial trip limits are in both lbs ww or lbs gw. In this analysis the commercial logbook data was converted to ww to provide a more conservative analysis. Figure F-5 provides the season 1 distribution of greater amberjack harvested per trip in the commercial sector from 2015 to 2020. There are about 8% of trips that exceeded the current South Atlantic greater amberjack 1,200 pound trip limit.

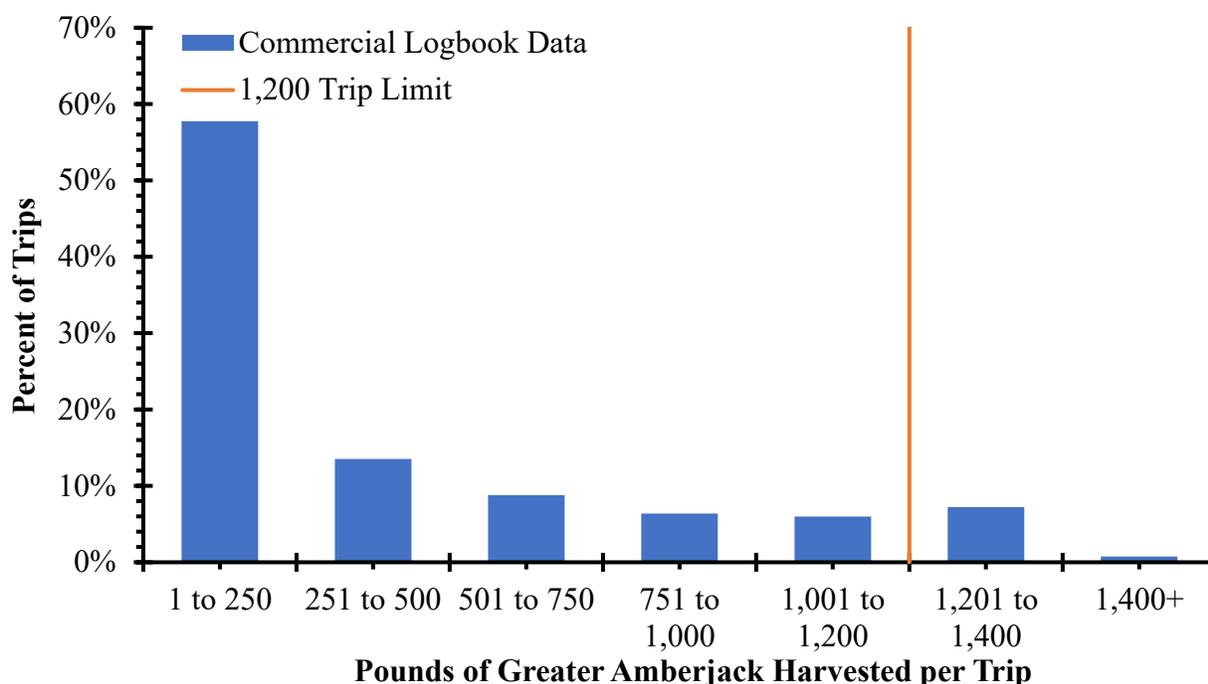

Figure F-5. Distribution of the South Atlantic greater amberjack commercially harvested per trip (lbs ww) for season 1. Season 1 is from March 1 through August 31. Data comes from the commercial logbook dataset from 2016 to 2020 (n = 7,720 trips), and the weight unit is in lbs ww. The orange line represents the current commercial trip limit of 1,200 lbs ww.

The impact from increasing the trip limit in season 1 was evaluated assuming that trips that met the current trip limit in recent years will also meet the new trip limit. This provides a maximum estimated harvest rate that may occur if the trip limit is increased. Not all trips meeting the current trip limit will likely meet newly proposed trip limits, but information is not available to determine exactly how many additional lbs of greater amberjack these trips would harvest once the trip limit is increased. Trips that met the current trip limit were defined as trips that landed 1,001 to 1,200 lbs. Therefore, the proposed trip limit of 1,500 lbs is being explored by adjusting any trips that had 1,001 to 1,200 lbs per trip, and adjusting them to meet the new trip limit of 1,500 lbs per trip. The range starts at 1,001 lbs instead of 1,200 lbs to account for any trips that

were close to but under the current trip limit of 1,200 lbs. Trips that harvested below 1,001 lbs per trip were not modified. Trips with landings greater than the current trip limit of 1,200 lbs were not changed since these trips did not follow the current trip limit in the past, and will probably not follow the new implemented trip limit in the future. This modified trip limit analysis was conducted using only season 1 data (March through August) from 2016 to 2020. The analysis resulted in estimated percent increase in commercial landings from increasing the commercial trip limit, and the results are provided in Table F-12. The percent increase in landings estimated from increasing the trip limit were applied to the projected landings to generate predicted closure dates. Table F-13 provides the predicted closure dates from analyzing the different trip limit increases for the Action 2 Preferred Alternative 3. Most of the scenarios resulted in no closures, and the earliest closure was June 14.

Table F-12. Calculated percent increase in commercial landings for the different Amendment 49 Action 5 season 1 trip limit alternatives using the recent commercial logbook data (2016-2020).

Trip Limit	Percent Increase in Landings
1,200	0.0
1,500	3.5
2,000	9.2
2,500	14.9

Table F-13. The projected closure dates for the greater amberjack commercial sector season 1 for a range of commercial ACLs from increasing the trip limit. The closure dates were generated from the three different landings scenarios of 1) three-year average of the most recent years of complete data, 2) five-year average of the most recent years of complete data, and 3) the maximum landings in the last five years of complete data. The landings were compared against the ACLs for Action 2 Preferred Alternative 3.

	Year	Commercial ACL Season 1	Scenario 1	Scenario 2	Scenario 3

	2026/2027	538,933	None	30-Aug	14-Jun

Allow commercial harvest of greater amberjack in April

Commercial harvest of greater amberjack in the month of April has been closed since it was implemented in 1999 by Amendment 9. Action 6 of Amendment 49 considers opening up the commercial sector to greater amberjack harvest in the month of April. Since the commercial sector has been closed in the month of April for more than twenty years, predicted April landings came from taking the average of the landings from the two closest months to April (March and May from 2016 to 2020). Table F-14 provide the results of the predicted April landings, and the predicted April landings are also shown in Figure F-6. Table F-15 estimates the closure dates from applying the predicted April landings to the predicted landings for the rest of the months in season 1.

Table F-14. Predicted South Atlantic greater amberjack commercial landings for the month of April for the three different landings scenarios. The three different landings scenarios are 1) three-year average of the most recent years of complete data, 2) five-year average of the most recent years of complete data, and 3) the maximum landings in the last five years of complete data.

Landing Scenario	April Landings (lbs gw)
3 year average	93,451
5 year average	136,748
Max	204,985

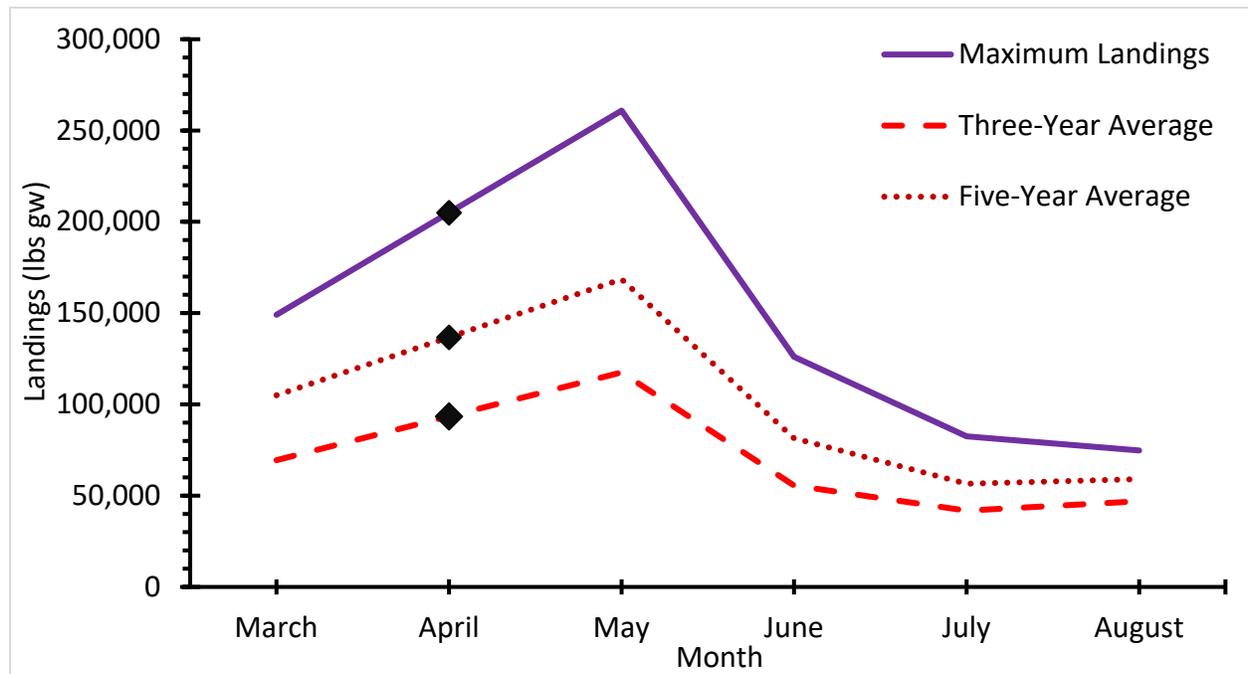

Figure F-6. South Atlantic greater amberjack commercial landings by month for season 1 from 2016 to 2020, three-year average, and five-year average with predicted April landings. Predicted April landings are represented with a black diamond. Season 1 is from March through August, and the landings are in lbs gw.

Table F-15. The projected closure dates for the greater amberjack commercial sector season 1 if the commercial sector was open to commercial harvest in April. The closure dates were generated from three different landings scenarios of 1) three-year average of the most recent years of complete data, 2) five-year average of the most recent years of complete data, and 3) the maximum landings in the last five years of complete data. The landings were compared against the ACLs for Action 2 Preferred Alternative 3.

	Year	Commercial ACL Season 1	Scenario 1	Scenario 2	Scenario 3
			Closure Date	Closure Date	Closure Date
Preferred Alternative 3	2022/2023	884,423	None	None	26-Aug
	2024/2025	569,019	None	11-Aug	26-May
	2026/2027	538,933	None	26-Jul	22-May

Combination of the Season 1 trip limit increases with the commercial sector being open in April Amendment 49 has the option to increase the commercial trip limit for season 1 and also open April to commercial harvest of greater amberjack. Table F-16 provides predicted closures dates by combining the increased harvest from both the increased trip limits and opening the commercial sector in April. The closure dates range from May 14 to no closure.

Table F-16. The projected closure dates for the greater amberjack commercial sector season 1 for the various trip limit increases and if the commercial sector was open to commercial harvest in April. The closure dates were generated from three different landings scenarios of 1) three-year average of the most recent years of complete data, 2) five-year average of the most recent years of complete data, and 3) the maximum landings in the last five years of complete data. The landings were compared against the ACLs for Action 2 Preferred Alternative 3.

	Year	Commercial ACL Season 1	Scenario 1	Scenario 2	Scenario 3

Season 2: September 1 through February 28

Predicting Commercial Landings

Commercial landings data for South Atlantic greater amberjack were obtained from the Southeast Fisheries Science Center (SEFSC) on September 29, 2021. Future commercial landings were determined from reviewing recent commercial landings data. The greater amberjack commercial season 2 is September 1 through February 28. Therefore, season 2 is split between two different years such as September 1, 2019 through February 28, 2020, and this example would generate the 2019/2020 season. Season 2 has had some closures in recent years. The season 2 years of 2015/2016, 2016/2017, 2017/2018 all had closures that prevented a full six months of an open season 2. The most recent three years of complete data are from the fishing seasons of 2014/2015, 2018/2019, and 2019/2020. These data were used to generate two potential future commercial landings scenarios: 1) three year average of the most recent years of complete data (2014/2015, 2018/2019, and 2019/2020), and, 2) the maximum landings in the last five years. The year with the maximum commercial landings in season 2 in the last five years came from 2014/2015. Table F-17 and Figure F-7 displays the season 2 commercial landings used in this analysis.

Table F-17. South Atlantic greater amberjack commercial landings by month for season 2 for recent years that did not have a closure, and the three-year average. The three year average came from the most recent years of complete data (2014/2015, 2018/2019, and 2019/2020), lbs gw. Season 2 is from September through February.

	September	October	November	December	January	February
2014/2015	78,817	102,624	33,172	42,725	48,806	37,245
2018/2019	44,968	41,420	39,110	31,204	26,208	28,613
2019/2020	30,015	27,851	23,853	15,078	15,743	15,667
3 Year Average	51,267	57,298	32,045	29,669	30,253	27,175

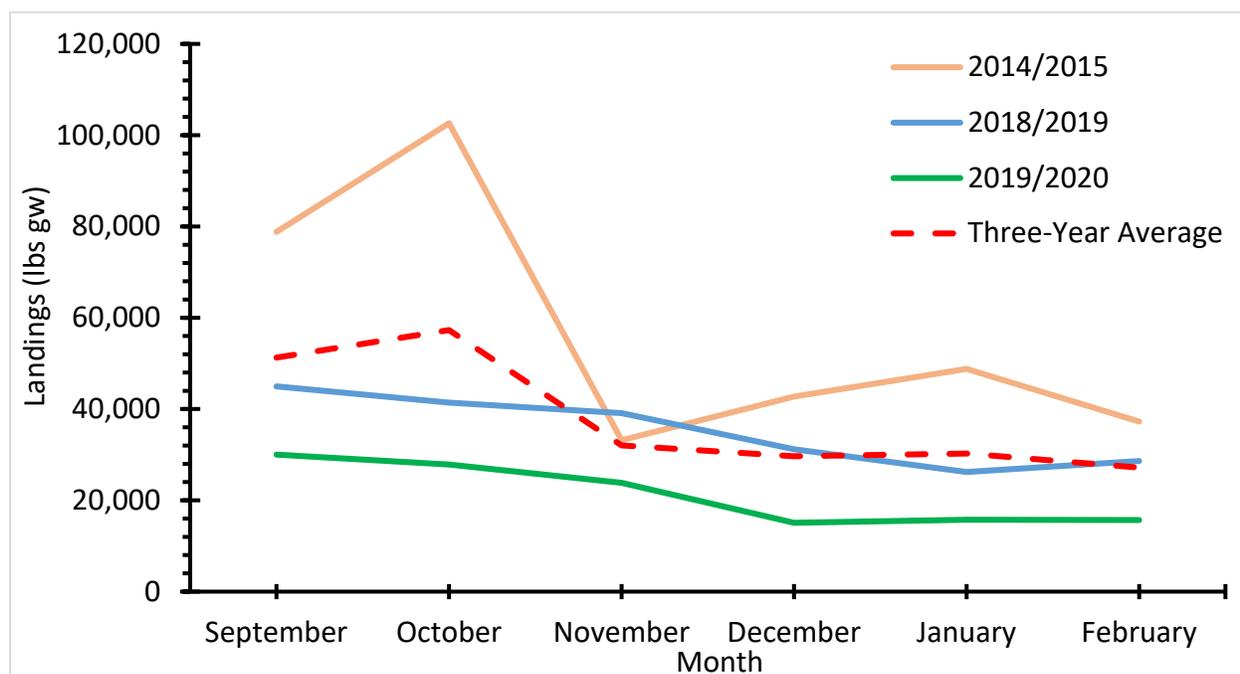

Figure F-7. South Atlantic greater amberjack commercial landings by month for season 2 for recent years that did not have a closure, and the three-year average. The three year average came from the most recent years of complete data (2014/2015, 2018/2019, and 2019/2020), in lbs gw. Season 2 is from September through February.

Season lengths were projected by cumulatively summing the commercial landings for the two landings scenarios, and compare the results to the Action 2 Preferred Alternative. Season length analysis was conducted for all three Action 2 alternatives. However, to simplify the analysis only the preferred alternative (Alternative 1 of Action 2) was analyzed for the other actions relating to the commercial season 2. Additionally, since Alternative 1 provides a range of five different ACLs, only the lowest, middle, and highest ACLs were included in the analysis. Table F-18 provides the predicted closure dates, and the preferred Alternative 1 of Action 2 ACLs did not result in any closures.

Table F-18. The projected closure dates for the greater amberjack commercial sector season 2 for different ACLs for Action 2. The closure dates were generated from the two different landings scenarios of 1) three-year average of the most recent years of complete data, and, 2) the maximum landings in the last five years.

Alternative	Year	Commercial ACL Season 2	Scenario 1	Scenario 2
			Closure Date	Closure Date
1	2022/2023	684,965	None	None
	2024/2025	440,692	None	None
	2026/2027	417,391	None	None
2	2022/2023	502,689	None	None

	2026/2027	513,269	None	None

Impact from Decreasing the Commercial Minimum Size Limit in Season 2

Action 4 of Amendment 49 considers a decrease to the commercial minimum size limit. As discussed earlier in this report, reliable estimates of percent changes in harvest from decreasing the minimum size limit are not possible because of two factors: 1) low number of available data on discarded greater amberjack lengths, and, 2) not having a reliable estimate of the proportion of discards to the total South Atlantic greater amberjack commercial catch. Reducing the minimum size limit will allow harvest of smaller greater amberjack which will likely increase harvest.

Impact from Increasing the Trip Limit for Season 2

Action 5 of Amendment 49 also considers increasing the commercial trip limit in season 2. Commercial logbook data provides the lbs harvested per trip, and commercial logbook data were provided from the SEFSC on May 2, 2021. The current trip limit is 1,000 lbs and Alternative 3 and its sub-alternatives for Action 5 is considering increasing the season 2 trip limit to 1200, 1500, 2000, and 2,500 pounds. Figure F-8 provides the season 2 distribution of greater amberjack harvested per trip in the commercial sector from 2015 to 2020. Approximately 9% of trips in recent years exceeded the current trip limit of 1,000 lbs.

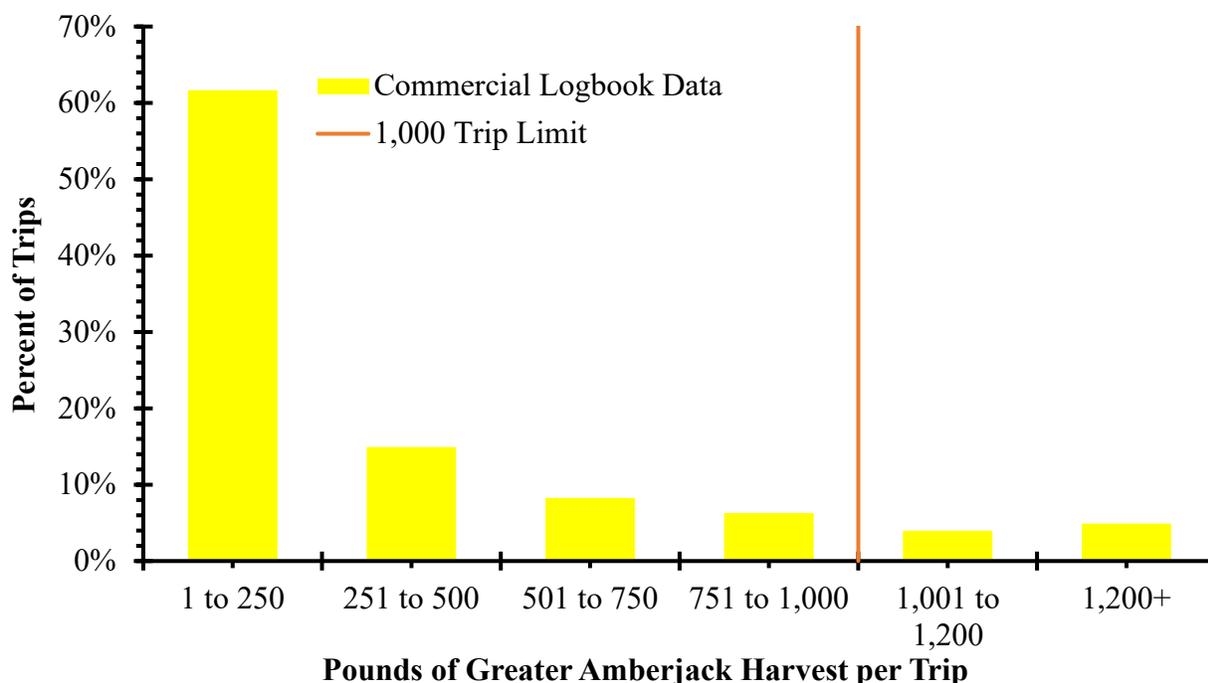

Figure F-8. Distribution of the South Atlantic greater amberjack commercially harvested per trip (lbs ww) for season 2. Season 2 is from September 1 through February 28. Data comes from the commercial logbook dataset from 2015 to 2020 (n = 3,075 trips), and the weight unit is lbs ww. The orange line represents the current commercial trip limit of 1,000 lbs ww.

The impact from increasing the trip limit in season 2 was evaluated assuming that trips that met the current trip limit in recent years will also meet the new trip limit. This provides a maximum estimated harvest rate that may occur if the trip limit is increased. Not all trips meeting the current trip limit will likely meet newly proposed trip limits, but information is not available to determine exactly how many additional lbs of greater amberjack these trips would harvest once the trip limit is increased. Trips that met the current trip limit were defined as trips that landed 751 to 1,000 lbs. Therefore, the proposed trip limit of 1,200 lbs is being explored by adjusting any trips that had 751 to 1,000 lbs per trip, and adjusting them to meet the new trip limit of 1,200 lbs per trip. The range starts at 751 lbs instead of 1,000 lbs to account for any trips that were close but under the current trip limit. Trips that harvested below 751 lbs were not modified. Trips with landings greater than the current trip limit of 1,000 lbs were not changed since these trips did not follow the current trip limit in the past, and will probably not follow the implemented trip limit in the future. This modified trip limit analysis was only done using season 2 data (September through February) from 2015 to 2020. The analysis resulted in estimated percent increase in commercial landings from increasing the commercial trip limit, and the results are provided in Table F-19. The percent increase in landings estimated from increasing the trip limit were applied to the projected landings to generate predicted closure dates. Table F-20 provides the predicted closure dates from the increase in the trip limit. Most of the scenarios resulted in no closures, and the closures that were predicted ranged from January 10 to February 24.

Table F-19. Calculated percent increase in commercial landings for the different Amendment 49 Action 5 season 2 trip limit alternatives using the recent commercial data (2015-2020).

Trip Limit	Percent Increase in Landings
1,000	0.0
1,200	5.9
1,500	12.3
2,000	22.0
2,500	31.8

Table F-20. The projected closure dates for the greater amberjack commercial sector season 2 for a range of commercial ACLs from increasing the trip limit. The closure dates were generated from the two different landings scenarios of 1) three-year average of the most recent years of complete data, and 2) the maximum landings in the last three years of complete data. The landings were compared against the Action 2 Preferred Alternative 3 ACLs.

Appendix G. Bycatch Practicability Analysis (BPA)

Amendment 49 to the Fishery Management Plan (FMP) for the Snapper Grouper Fishery of the South Atlantic Region (Snapper Grouper FMP) would modify management of South Atlantic greater amberjack. Actions include revising annual catch limits (ACL), sector allocations and management measures for the commercial and recreational sectors. Development of Amendment 49 to the Snapper Grouper FMP (Amendment 49) is a response to the most recent stock assessment for South Atlantic greater amberjack (SEDAR 59 2020).

National Standard 9 of the Magnuson-Stevens Act states that “Conservation and management measures shall, to the extent practicable, (A) minimize bycatch and (B) to the extent bycatch cannot be avoided, minimize the mortality of such bycatch.” The Magnuson-Stevens Act defines “bycatch”, in part, as fish which are harvested in a fishery, but which are not sold or kept for personal use, and includes economic discards and regulatory discards. The National Marine Fisheries Service (NMFS) outlines, at 50 C.F.R. §600.350(d) (3) (i), ten factors that should be considered in determining whether a management measure minimizes bycatch or bycatch mortality to the extent practicable.

1. Population effects for the bycatch species.
2. Ecological effects due to changes in the bycatch of that species (effects on other species in the ecosystem).
3. Changes in the bycatch of other species of fish and the resulting population and ecosystem effects.
4. Effects on marine mammals and birds.
5. Changes in fishing, processing, disposal, and marketing costs.
6. Changes in fishing practices and behavior of fishermen.
7. Changes in research, administration, and enforcement costs and management effectiveness.
8. Changes in the economic, social, or cultural value of fishing activities and non-consumptive uses of fishery resources.
9. Changes in the distribution of benefits and costs.
10. Social effects.

Bycatch Reporting Requirements and Methodology

For the commercial sector, the vessel reporting requirement is achieved through logbooks. Fishermen with Commercial South Atlantic Unlimited Snapper Grouper or 225-lb Trip Limit Snapper Grouper Permits, who are selected by the Science and Research Director, are required to maintain and submit fishing records through the NMFS Southeast Fisheries Science Center (SEFSC) Commercial Logbook. Discard data are collected using the Supplemental Discard Logbook that is sent to a 20% stratified random sample of the active commercial permit holders in the fishery. In addition to the number of self-reported discards per trip and gear, the SEFSC Supplemental Discard Logbook attempts to quantify the reason why discarding occurs using four codes.²² Fishermen can specify multiple reasons for a species discarded on the same trip and gear.

²² More information on the discard logbook is available here <https://www.fisheries.noaa.gov/about/southeast-fisheries-science-center>.

- 1) Regulation – Not legal size: Animals that would have been sold, however local or federal size limits forbid it.
- 2) Regulation – Out of season: Animals that would have been sold, however the local or federal fishing season is closed.
- 3) Regulation – Other: Animals that would have been sold, however a local or federal regulation other than size or season, forbids it (Other than size or season; i.e., protected species, not properly permitted).
- 4) Market conditions: Animals that have no market value (rotten, damaged).

For the recreational sector, estimates of discards from private recreational and charter fishermen are collected through the Marine Recreational Information Program (MRIP)/Fishing Effort Survey (FES). As discussed earlier in Amendment 49, the MRIP/FES replaced the Marine Recreational Fishery Statistics Survey. The Southeast Region Headboat Survey, which includes limited headboat observer sampling, collects discard information from headboat vessels. In addition, in January 2021, NMFS implemented the Southeast For-Hire Electronic Reporting Program, which implemented mandatory electronic reporting of for-hire vessel catch data for over 3,000 vessels in the Gulf of Mexico and South Atlantic. The purpose of this program is to provide more accurate and reliable fisheries information about for-hire catch, effort, and discards.

G.1. Population Effects for the Bycatch Species

G.1.1. Amount and Type of Bycatch and Discards

Commercial Sector

The South Atlantic snapper grouper fishery is characterized by moderately high discards, especially of vermilion snapper, black sea bass, and red porgy (Table G-1 and Figure G-1). Most discards originate from handline/electric rig and trap gear, with some discards from trolling gear and relatively low discards from longline and diving gear. Trap/pot gear show high levels of discarded black sea bass, which is the targeted species of this gear type, but low levels of bycatch for other species. It is possible that trip-level reporting leads to the relatively high discard estimates from trolling gear; these may be sets using another gear type (i.e., handline/electric rig) on a trip declared as a trolling gear trip. The ratio of commercial landings to commercial discards is not compared because commercial landings are reported in lbs and discards are reported in numbers of fish.

Table G-1. Top ten species with mean estimated South Atlantic commercial discards (number of fish) during snapper grouper trips (defined as trips with >50% of landings from snapper grouper stocks), sorted from largest to smallest, by gear, for the 2015-2019 period.

Stock	Diver	Stock	Handline / Electric	Stock	Longline	Stock	Trap / Pot	Stock	Troll
Gray Snapper	133	Vermilion Snapper	23,324	Red Grouper	176	Black Sea Bass	25,581	Black Sea Bass	1,114
Hogfish	57	Red Porgy	20,337	Snowy Grouper	157	Triggerfishes	1,507	Grunts	66
Black Grouper	28	Red Snapper	16,805	Blueline Tilefish	32	Vermilion Snapper	662	King Mackerel	34
Ocean Triggerfish	10	Black Sea Bass	7,797	Greater Amberjack	26	Gray Triggerfish	407	White Grunt	24
Mutton Snapper	8	Yellowtail Snapper	7,278	Red Snapper	20	White Grunt	207	Gag	19
Red Grouper	5	Gray Triggerfish	3,966	Red Porgy	18	Grunts	161	Dolphin	16

Figure G-1. Expanded self-reported commercial discards (numbers of fish) for the top ten species discarded during snapper grouper trips (defined as trips with >50% of landings from snapper grouper stocks) from 2010-2019 for all gear types.

Source: SEFSC Coastal Logbook (accessed May 2020) and Discard Logbook (accessed May 2020).

Of the four discard codes, regulations (i.e., not legal size and out of season) was the most common reason selected for the most commonly discarded snapper grouper species based on

self-reported discards (Table G-2). The minimum size limit appears to be the primary driver of commercial discards for black sea bass, gag, gray snapper, gray triggerfish, greater amberjack, and yellowtail snapper. Out of season appears to be the primary driver of discards for almaco jack, red porgy, red snapper, and vermilion snapper.

Table G-2. The percentage of unexpanded discards for each discard reason out of the total number of self-reported discards reported to the Supplemental Discard Logbook for the top ten snapper grouper species discarded in the South Atlantic from 2015 through 2019. Some percentages may not sum to 100% due to rounding.

Species	Not Legal Size	Out of Season	Other Regulations	Market Conditions
Almaco Jack	4%	72%	7%	17%
Black Sea Bass	99%	0%	0%	0%
Gag	78%	20%	0%	2%
Gray Snapper	91%	0%	0%	8%
Gray Triggerfish	59%	39%	1%	0%
Greater Amberjack	77%	20%	3%	1%
Red Porgy	19%	78%	2%	0%
Red Snapper	2%	78%	20%	0%
Vermilion Snapper	43%	50%	7%	0%
Yellowtail Snapper	92%	6%	2%	0%

Sources: SEFSC Supplemental Commercial Discard Logbook (May 2020).

Recreational Sector

From 2015 through 2019, the most discarded species on trips capturing a snapper grouper species was black sea bass for all three modes (Table G-3). Red snapper, tomtate, yellowtail snapper, and grunt species were in the top ten for all modes.

Table G-3. From 2015 through 2019, the top ten species with discards reported on trips capturing a snapper grouper species by recreational mode. Species are sorted by number of total discards for each mode from 2015-2019.

Rank	HEADBOAT		CHARTER		PRIVATE	
	Species	Discards (N)	Species	Discards (N)	Species	Discards (N)
1	Black Sea Bass	2,362,007	Black Sea Bass	1,464,909	Black Sea Bass	40,129,026
2	Vermilion Snapper	461,562	Red Snapper	601,973	Gray Snapper	21,989,786
3	Tomtate	327,379	Yellowtail Snapper	529,770	Pinfish	10,632,466
4	White Grunt	294,025	Tomtate	472,005	Red Snapper	9,907,110
5	Yellowtail Snapper	278,821	Vermilion Snapper	416,724	Yellowtail Snapper	6,926,752
6	Red Snapper	258,627	Gray Snapper	275,171	Tomtate	6,619,263
7	Gray Triggerfish	183,024	Mutton Snapper	149,472	Hardhead Catfish	5,036,604
8	Blue Runner	121,476	Blue Runner	133,872	Grunt (family)	4,961,629
9	Grunts (unidentified)	99,496	Grunt (family)	128,757	Atlantic Croaker	4,675,997
10	Atlantic Sharpnose Shark	90,504	Greater Amberjack	112,017	Gray Triggerfish	3,828,858

Sources: MRIP FES data from SEFSC Recreational ACL Dataset (September 2020); Headboat data from SEFSC Headboat Logbook CRNF files (expanded; July 2020).

Recreational discards of several snapper grouper species are higher than the landings for certain modes of fishing (Table G-4). Red snapper, black sea bass, red grouper, and tomtate discards are many times higher than their landings across all modes. Across most of the snapper grouper species, the magnitude of private mode discards is much higher compared to the headboat or charter modes. Greater amberjack recreational discards to landings ratios are 95% in the headboat component, 91% in the charter component, and 186% in the private recreational component.

Table G-4. South Atlantic snapper grouper headboat, charter, and private mean annual estimates of landings and discards (2015-2019). Headboat and MRIP (charter and private) landings and discards are in numbers of fish.

Species	HEADBOAT			CHARTER			PRIVATE		
	Landings (N)	Discards (N)	Ratio (D:L)	Landings (N)	Discards (N)	Ratio (D:L)	Landings (N)	Discards (N)	Ratio (D:L)
Almaco Jack	8,345	1,683	20%	12,752	2,921	23%	70,012	237,235	339%

G.1.2. Practicability of Management Measures in Directed Fisheries Relative to their Impact on Bycatch and Bycatch Mortality

Expected Impacts on Bycatch for the Subject Amendment Actions

Action 1 would revise the overfishing limit, acceptable biological catch (ABC), total ACL, and annual optimum yield (OY) for greater amberjack. The Council selected **Alternative 2** as the preferred alternative, which proposes an ABC, total ACL, and annual OY that are equal to the ABC level recommended by the Council's SSC. **Preferred Alternative 2** would allow for more fish to be harvested and reduce the likelihood of in-season closures. Therefore, it is expected that there would be a decrease in bycatch because more fish can be kept rather than discarded, which is indirectly beneficial to the greater amberjack stock. Fishing effort or behavior is not expected to change for the overall snapper grouper fishery; thus, no changes in bycatch of co-occurring species are expected as a result of Action 1.

Action 2 would revise the sector allocations for greater amberjack and sector ACLs to reflect the updated ABC level recommended by the Council's SSC and chosen by the Council. The Council selected **Alternative 3** as the preferred alternative, which proposes an allocation of 35.00% of the greater amberjack total ACL to the commercial sector and 65.00% to the recreational sector. This allocation scenario modestly increases the recreational sector allocation and decreases the commercial sector allocation from the status quo. In general, reducing sector allocations results in less landings available to a sector for harvest and increases the likelihood of an in-season closure. Therefore, in-season closures could have adverse effects to the stock if during the closure, not all fish returned to the water survive. However, since it is estimated that South Atlantic greater amberjack have a low release mortality rate of 20% for both sectors (sensitivity range: 10-30%) (SEDAR 15 2008 and SEDAR 59 2020), should an in-season closure occur, any dead discards are expected to be minimal.

Action 3 would reduce the commercial minimum size limit for greater amberjack. The Council selected **Alternative 3** as the preferred alternative. The regulation 'not legal size' was the most common reason selected for release of greater amberjack (Table G-2). Reducing the current 36-inch fork length (FL) commercial minimum size limit for greater amberjack under **Preferred Alternative 3** would likely reduce discards compared to **Alternative 1 (No Action)**. Doing so is expected to increase commercial landings as more fish that would be discarded could be kept. Since greater amberjack has a low estimated release mortality (20%), a high percentage of released fish likely survive; therefore, any dead discards are expected to be minimal, potentially resulting in minimal adverse long-term population effects from any change in the numbers of discards. There is no anticipated change to fishing activity or behavior in the snapper grouper commercial sector and thus no changes in bycatch of co-occurring species are expected as a result of Action 3.

Action 4 would increase commercial trip limits for greater amberjack. The selected **Alternative 3, Sub-Alternative 3a** as the preferred alternative. In addition to the low release mortality rate of 20% estimated for greater amberjack in the South Atlantic (SEDAR 15 2008 and SEDAR 59 2020), increasing the Season 2 commercial trip limit could result in fewer discards of greater amberjack compared to **Alternative 1 (No Action)** because more fish could be kept. Reducing the discards would be beneficial to the greater amberjack stock.

Action 5 would revise the April spawning closure greater amberjack. The Council selected **Alternative 2** as the preferred alternative which would specify that during April each year, no person may sell, purchase, harvest, or possess a greater amberjack from the South Atlantic EEZ and the harvest and possession limits are zero. **Preferred Alternative 2** would result in additional, and positive, indirect biological effects if greater harvest restrictions are applied during the peak spawning month of April. Although regulatory discarding may slightly increase since a bag limit is not allowed and fish would need to be discarded rather than kept, greater amberjack have a low release mortality rate of 20% and the effects to the stock should be minimal. Therefore, **Preferred Alternative 2** would offer some protection to the stock and also indirectly provide the greatest biological benefits compared to the other considered alternatives in that it encompasses stricter management measures for both sectors during spawning season.

Action 6 would remove recreational annual catch targets (ACT) from the Snapper Grouper Fishery Management Plan (FMP). The Council selected **Alternative 2** as the preferred alternative, which would remove ACTs for species managed under the FMP. This action would not be expected to affect discards and/or bycatch, since the only consequence of reaching the ACT would be to continue to monitor the landings, which the Marine Recreational Information Program does continually.

Past, Current, and Future Actions to Prevent Bycatch and Improve Monitoring of Harvest, Discards, and Discard Mortality

Actions taken in the Snapper Grouper FMP related to management of greater amberjack, including actions that could reduce bycatch and bycatch mortality of greater amberjack and other snapper grouper species, are outlined in Section 1.8 of this amendment. Other past, current, and future actions that could prevent bycatch and/or improve monitoring of harvest, discards, and discard mortality are included below.

Amendment 16 to the Snapper Grouper FMP (SAFMC 2009) required the use of dehooking devices, which could help reduce bycatch mortality of snapper grouper species. Dehooking devices can allow fishermen to remove hooks with greater ease and more quickly without removing the fish from the water. If a fish does need to be removed from the water, de-hookers reduce handling time thus increasing survival (Cooke et al. 2001).

Amendment 17A to the Snapper Grouper FMP (SAFMC 2010) required circle hooks for snapper grouper species north of 28 degrees latitude, which has likely reduced bycatch mortality of some snapper grouper species.

The Comprehensive Ecosystem-Based Amendment 2 (CE-BA 2; SAFMC 2011a) included actions that modified management of special management zones (SMZ) off South Carolina; revised sea turtle release gear requirements for the snapper grouper fishery that were established in Amendment 15B to the Snapper Grouper FMP (SAFMC 2008); and designated new essential fish habitat (EFH) and EFH-Habitat Areas of Particular Concern in the South Atlantic. CE-BA 2 also included an action that limited harvest and possession of snapper grouper and coastal migratory pelagic (CMP) species to the bag limit in the special management zone (SMZ) off South Carolina. This action likely reduced bycatch around SMZs by restricting commercial

harvest in the area, but has probably had limited effect on the magnitude of overall bycatch of snapper grouper species in the South Atlantic.

The Comprehensive ACL Amendment (SAFMC 2011b) implemented ACLs and AMs for species not undergoing overfishing in the FMPs for snapper grouper, dolphin and wahoo, golden crab, and *Sargassum*, in addition to other actions such as allocations and establishing annual catch targets for the recreational sector. ACLs and AMs have likely reduced bycatch of target species as well as incidentally caught species.

The Council's Headboat Electronic Reporting Amendment (SAFMC 2013) changed the reporting frequency by headboats from monthly to weekly, and required that reports be submitted electronically. The action is expected to provide more timely information on landings and discards. Improved information on landings would help ensure ACLs are not exceeded. Furthermore, more timely and accurate information would be expected to provide a better understanding of the composition and magnitude of catch and bycatch, enhance the quality of data provided for stock assessments, increase the quality of assessment output, and lead to better decisions regarding additional measures to reduce bycatch.

Amendment 36 to the Snapper Grouper FMP (SAFMC 2016) established spawning SMZs and is expected to reduce bycatch of many snapper grouper species, especially speckled hind and Warsaw grouper.

The Council developed a joint For-Hire Reporting Amendment (SAFMC 2017) with the Gulf of Mexico Fishery Management Council that requires all federally permitted charter vessels report landings information weekly to the SEFSC electronically. Additionally, the Councils have also begun development of a joint amendment to require that all federally permitted commercial fishing vessels in the southeast also report their logbook landings information electronically. These future actions will help to improve estimates on the composition and magnitude of catch and bycatch of species affected by this amendment, as well as all other federally managed species in the southeast region.

Amendment 42 to the Snapper Grouper FMP (SAFMC 2019c) modified sea turtle release gear regulations for the commercial snapper grouper fishery and modified the snapper grouper framework so the Council may more quickly modify sea turtle and other protected resources release gear and handling requirements in the future.

Regulatory Amendment 29 to the Snapper Grouper FMP (SAFMC 2020) required descending devices be on board all commercial, for-hire, and private recreational vessels while fishing for or possessing snapper grouper species; the use of non-offset, non-stainless steel circle hooks when fishing for snapper grouper species with hook-and-line gear and natural baits north of 28° N latitude; and all hooks be non-stainless steel when fishing for snapper grouper species with hook-and-line gear and natural baits throughout South Atlantic federal waters. The Council has also implemented an extensive outreach and public education program, which along with its citizen science initiative is promoting best fishing practices for all the species it manages.

Regulatory Amendment 31 to the Snapper Grouper FMP (included in the Comprehensive Recreational AMs Amendment) could include actions to revise recreational AMs to allow more flexibility in managing recreational fisheries.

Regulatory Amendment 35 to the Snapper Grouper FMP will address results of the latest stock assessment for the red snapper stock in the southeast, release mortality issues in the snapper grouper fishery, and modifications to red snapper catch levels.

Amendment 46 to the Snapper Grouper FMP proposes actions to focus on private recreational permit and reporting.

These past, current, and potential future actions will help to improve estimates on the composition and magnitude of catch and bycatch of federally managed species in the southeast region and minimize discard mortality. Additional information on fishery related actions from the past, present, and future considerations can be found in Chapter 6 (Cumulative Effects) of the amendment.

G.2. Ecological Effects Due to Changes in Bycatch

Release mortality rates for the snapper grouper fishery are widely variable species to species and sector to sector, and are dependent on fishing mode (Table G-5). For instance, recreational discards of red snapper in the South Atlantic are a main driver in the overfishing determination for the stock (SEDAR 41 2017). However, discard mortality estimates for snapper grouper species are variable and highly uncertain. Generally, release mortality is highly correlated with depth for snapper grouper species, with highest mortality among fish captured in deep water (Campbell et al. 2014; Pulver 2017; Rudershausen et al. 2014; Stephen and Harris 2010; Wilson and Burns 1996). Greater amberjack are typically found in 60 to 240 feet of water and juveniles may occur in water less than 30 feet deep ([FWC](#)). It is estimated that South Atlantic greater amberjack have a low release mortality rate of 20% (sensitivity range: 10-30%) (SEDAR 15 2008 and SEDAR 59 2020), and any dead discards are expected to be minimal.

Table G-5. Release mortality rates of select recreationally and commercially important snapper-grouper species from recent stock assessments.

Species	Fishery	Release mortality	Data Source
Black Sea Bass	Recreational	13.7%	SEDAR 56 (2018)
Black Sea Bass	Commercial Trap/Pot (2007- present)	6.8%	SEDAR 56 (2018)
Black Sea Bass	Commercial Vertical Line	19%	SEDAR 56 (2018)
Gag	Recreational	25%	SEDAR 10 Update (2014)
Gag	Commercial	40%	SEDAR 10 Update (2014)
Gray Triggerfish	Recreational & Commercial	12.5%	SEDAR 41 (2016)
Greater Amberjack	Recreational & Commercial	20%	SEDAR 59 (2020)
Red Porgy	Recreational	41%	SEDAR 60 (2020)

Species	Fishery	Release mortality	Data Source
Red Porgy	Commercial	53%	SEDAR 60 (2020)
Red Snapper	Recreational - Private	23%	SEDAR 73 (2021)
Red Snapper	Recreational - Charter & Headboat	22%	SEDAR 73 (2021)
Red Snapper	Commercial	32%	SEDAR 73 (2021)
Vermilion snapper	Recreational	38%	SEDAR 55 (2018)
Vermilion snapper	Commercial	41%	SEDAR 55 (2018)
Yellowtail snapper	Recreational	15%	SEDAR 64 (2020)
Yellowtail snapper	Commercial	12.5%	SEDAR 64 (2020)

It is likely that most mortality is a function of hooking and handling of the fish when the hook is being removed. Regulatory Amendment 29 to the Snapper Grouper FMP (SAFMC 2020) required descending devices be on board all commercial, for-hire, and private recreational vessels while fishing for or possessing snapper grouper species; the use of non-offset, non-stainless steel circle hooks when fishing for snapper grouper species with hook-and-line gear and natural baits north of 28° N latitude; and all hooks be non-stainless steel when fishing for snapper grouper species with hook-and-line gear and natural baits throughout South Atlantic federal waters. The Council also implemented an extensive outreach and public education program, which along with its citizen science initiative is promoting best fishing practices for all the species it manages. The goal of these regulations is to reduce discard mortality for snapper grouper species.

The actions contained in this amendment are not expected to result in substantial changes to bycatch in the snapper grouper fishery; thus, ecological effects due to changes in bycatch in this fishery are expected to be negligible. For more details on ecological effects, see Chapters 3 and 4 of this amendment.

G.3. Changes in the Bycatch of Other Fish Species and Resulting Population and Ecosystem Effects

Amendment 49 is not expected to result in changes in bycatch of other fish species. The snapper grouper fishery is characterized by a high number of discards for all species and sectors (Tables G-1 and G-3). Both sectors likely target a wide range of species, including dolphin wahoo, snapper grouper, and coastal migratory pelagic species during each trip. This results in a varied amount and type of bycatch of species. The top three species caught with greater amberjack in the South Atlantic region are dolphin (mahi mahi), vermilion snapper, and king mackerel (Table G-6). Any closures or reductions in fishing effort of South Atlantic greater amberjack has the potential to reduce the bycatch of these three species. However, the actions in this amendment are not expected to alter overall fishing activity or behavior in the fishery; thus, no changes in bycatch of other species are expected.

Table G-6. The top ten species that are commonly caught on recreational trips that caught greater amberjack in the South Atlantic region. This came from MRIP recreational landings from 2015 to 2019.

Species
Dolphin (mahi mahi)
Vermilion Snapper
King Mackerel
Black Sea Bass
Gray Triggerfish
Alamco Jack
Bluefish
Little Tunny
Red Snapper
White Grunt

G.4. Effects on Marine Mammals and Birds

Marine Mammals

Under Section 118 of the Marine Mammal Protection Act (MMPA), the NMFS must publish, at least annually, a List of Fisheries (LOF) that places all U.S. commercial fisheries into one of three categories based on the level of incidental serious injury and mortality of marine mammals that occurs in each fishery. The gears used to catch greater amberjack are nets, spear, longline and hook-and-line. The longline and hook-and-line gear components of the snapper grouper fishery, which is primarily the gear used to catch greater amberjack, are determined to have remote likelihood of / no known interactions with marine mammals (Category III, LOF, 87 FR 23122; April 19, 2022).

Sea Birds

The Bermuda petrel and roseate tern occur within the action area. Bermuda petrels are occasionally seen in the waters of the Gulf Stream off the coasts of North Carolina and South Carolina during the summer. Sightings are considered rare and only occurring in low numbers (Alsop 2001). Roseate terns occur widely along the Atlantic coast during the summer but in the southeast region, they are found mainly off the Florida Keys (unpublished US Fish and Wildlife Service data). Interaction with fisheries has not been reported as a concern for either of these species. Although, the Bermuda petrel and roseate tern occur within the action area, these species are not commonly found and neither has been described as associating with vessels or having had interactions with the dolphin wahoo fishery. Thus, the fishery is not likely to adversely affect the Bermuda petrel and the roseate tern.

G.5. Changes in Fishing, Processing, Disposal, and Marketing Costs

The actions proposed in Amendment 49 are not expected to substantially alter fishing practices, processing, disposal, or marketing costs in the near or short term in relation to bycatch or discards in the snapper grouper fishery. As shown in the analyses in Chapter 4 of the preferred

alternatives for actions potentially affecting catch, costs are not expected to change. Similarly in the long term, it is more likely that current fishing, processing, disposal, and marketing costs would be maintained at or near their status quo levels, thus leading to no anticipated changes.

G.6. Changes in Fishing Practices and Behavior of Fishermen

As discussed above, the actions proposed in Amendment 49 are not expected to change fishing practices or fishing behavior, and are likely to have little effect on the overall magnitude of discards. Also, any changes to fishing behavior and subsequent changes in the level of discards or discard mortality that may result from the actions in the amendment are expected to be small, and would not jeopardize the sustainability of any target or non-target species.

G.7. Changes in Research, Administration, and Enforcement Costs and Management Effectiveness

Research

Research and monitoring is ongoing to understand the effectiveness of implemented management measures and their effect on bycatch. The SEFSC is developing electronic logbooks, which could be used to enable fishery managers to obtain information on species composition, size distribution, geographic range, disposition, and depth of fishes that are released. Further, a joint Commercial Logbook Reporting Amendment is being developed by the Council and the Gulf of Mexico Fishery Management Council, which would require electronic reporting of landings information by federally permitted commercial vessels to increase the timeliness and accuracy of landings and discard data. The For-Hire Reporting Amendment requirements should improve timeliness and quality of data for the charter and headboat components of the recreational sector.

Cooperative research projects between science and industry are available each year in the form of grants from Marine Fisheries Initiative, Saltonstall-Kennedy program, and the Cooperative Research Program. These programs can provide research funds for observer programs, as well as gear testing and testing of electronic devices. A condition of funding for these projects is that data are made available to the Councils and NMFS upon completion of a study.

Administration

The proposed actions are not expected to significantly impact administrative costs.

Enforcement

The proposed actions are not expected to significantly impact enforcement costs.

G.8. Changes in the Economic, Social, or Cultural Value of Fishing Activities and Non-Consumptive Uses of Fishery Resources

Changes in economic, social, or cultural values are discussed in Chapter 4. None of the actions and alternatives in Amendment 49 are likely to change the current level of bycatch of target or non-target species in the South Atlantic, and thus are unlikely to change the social, economic, or cultural value of fishing activities and non-consumptive uses of the snapper grouper fishery.

G.9. Changes in the Distribution of Benefits and Costs

The distribution of benefits and costs expected from the proposed actions in Amendment 49 are discussed in the economic and social effects analysis in Chapter 4. These effects are discussed in relation to the baseline economic and social conditions of the fishery and fishing communities outlined in Chapter 3 of the document. Additionally, the Regulatory Impact Review (Appendix B) and Regulatory Flexibility Act Analysis (Appendix C) provide additional information on changes in the distribution of benefits and costs. Overall, this amendment is not expected to change bycatch in a way that would change the distribution of benefits and costs.

G.10. Social Effects

The baseline social environment and social effects of the proposed actions are described in Chapters 3 and 4 of Amendment 49, respectively. In general, fishermen become frustrated as waste of the resource increases due to regulatory bycatch of target and non-target species. This often results in a distrust of science because regulations are intended to protect stocks and rebuild overfished stocks by reducing such bycatch. However, none of the actions and alternatives in Amendment 49 are likely to change the current level of bycatch of target or non-target species in the South Atlantic and thus are unlikely to result in the negative social effects described.

G.11. Conclusion

This BPA evaluates the practicability of taking additional action to minimize bycatch and bycatch mortality using the ten factors provided at 50 C.F.R. § 600.350(d)(3)(i). In summary, the proposed actions in Amendment 49 are not likely to significantly contribute to or detract from the current level of bycatch in the snapper grouper fishery. The Council, NMFS, and the SEFSC have implemented, and plan to implement, numerous management measures and reporting requirements that have improved, or are likely to improve the monitoring efforts of discards and discard mortality.

Appendix H. Fishery Impact Statement

The Magnuson-Stevens Fishery Conservation and Management Act requires a Fishery Impact Statement (FIS) be prepared for all amendments to fishery management plans (FMP). The FIS contains an assessment of the expected and potential biological, economic, and social effects of the conservation and management measures on: 1) fishery participants and their communities; 2) participants in the fisheries conducted in adjacent areas under the authority of another Council; and 3) the safety of human life at sea. Detailed discussion of the expected effects for all proposed changes is provided in Chapters 1 and 2. The FIS provides a summary of these effects.

Actions Contained in Amendment 49 to the FMP for the Snapper Grouper Fishery of the South Atlantic Region (Amendment 49)

Amendment 49 would modify management of South Atlantic greater amberjack. Actions include revising the overfishing limit, acceptable biological catch (ABC), annual catch limits (ACL), annual optimum yield (OY), sector allocations, and management measures for the commercial and recreational sectors. Additionally, Amendment 49 removes the recreational annual catch targets (ACT) from the Snapper Grouper FMP. The actions and their preferred alternatives are:

- **Action 1.** Revise the greater amberjack ABC, total ACL, and annual OY.
 - **Preferred Alternative 2.** Revise the ABC and set it equal to the most recent recommendation from the Scientific and Statistical Committee (SSC). Revise the total ACL and annual OY for greater amberjack and set them equal to the recommended ABC. The recommended ABC is inclusive of recreational estimates from the Marine Recreational Information Program's (MRIP) Fishing Effort Survey (FES). The 2026/2027 total ACL and annual OY would remain in place until modified.
- **Action 2.** Revise the greater amberjack sector allocations and sector ACLs.
 - **Preferred Alternative 2.** Allocate 65.00% of the revised total ACL for greater amberjack to the recreational sector and 35.00% of the revised total ACL for greater amberjack to the commercial sector.
- **Action 3.** Reduce the commercial minimum size limits for greater amberjack
 - **Preferred Alternative 2.** Reduce the commercial minimum size limit to 32 inches fork length.
- **Action 4.** Increase the Season 2 commercial trip limit for greater amberjack.
 - **Preferred Alternative 3.** Modify the September 1 through the end of February (Season 2) commercial trip limit for greater amberjack to be:
 - **Preferred Sub-Alternative 3a.** 1,200 pounds gutted or whole weight.
- **Action 5.** Revise the April spawning closure for greater amberjack.
 - **Preferred Alternative 2.** Specify during April each year, no person may sell, purchase, harvest, or possess a greater amberjack from the South Atlantic exclusive economic zone and the harvest and possession limits are zero. This closure would apply to both the recreational and commercial sectors.
- **Action 6.** Remove recreational ACTs from the Snapper Grouper FMP.

- **Preferred Alternative 2.** Remove recreational ACTs for species managed under the Snapper Grouper FMP.

Assessment of Biological Effects

The preferred alternatives in Amendment 49 are designed to adjust harvest of greater amberjack to the new ACLs based on the most recent stock assessment for South Atlantic greater amberjack (SEDAR 59 2020). The proposed increase in the total ACL for greater amberjack is based on the South Atlantic Fishery Management Council's Scientific and Statistical Committee's recommended ABC for greater amberjack in the South Atlantic region, and is considered best scientific information available. SEDAR 59 (2020) indicates that the greater amberjack ACL can be increased without having negative effects on the sustainability of the stock.

Greater amberjack are often harvested incidentally when fishing for other snapper grouper species. Substantial changes in fishing effort or behavior are not expected as a result of this amendment, thus the proposed actions would not be expected to result in any biological effects, positive or negative, on co-occurring species (BPA, Appendix G). The proposed actions would not change fishing methods for snapper grouper species in the U.S. exclusive economic zone, and therefore would perpetuate the existing level of risk for interactions between Endangered Species Act listed species and the fishery. Thus, there is likely to be no additional effects, positive or negative, to protected species from the actions.

Assessment of Economic Effects

In general, ACLs that allow for more fish to be landed can result in increased positive economic effects if harvest increases without notable effects on the stock of a species. The ACL does not directly impact the fishery for a species unless harvest changes, fishing behavior changes, or the ACL is exceeded, thereby potentially triggering AMs such as harvest closures or other restrictive measure. In the case of greater amberjack, the revised total ACL in Action 2 would be constraining on harvest for the recreational sector but not for the commercial sector and is projected to reduce landings of greater amberjack as well as associated economic benefits for the recreational sector but increase landings of greater amberjack as well as associated economic benefits for the commercial sector. The net benefits of the action would be positive in the initial year of implementation but negative in subsequent years due to a decreasing total ACL over time. When examining sector allocations of the revised total ACL (Action 3), the revised sector allocations for greater amberjack would comparatively decrease net economic benefits for the commercial sector, increased net economic benefits for the recreational sector, and result in a net increase in total net economic benefits.

Reducing the commercial minimum size limit for greater amberjack in Action 3 would increase harvest since smaller fish that were previously discarded due to the current 36-inch minimum size limit could be landed. This would provide positive direct economic effects for the commercial sector provided there are no long-term negative effects for the stock from the increased harvest. In general, the lower the size limit, the more that overall harvest will increase in the short-term, thereby increasing economic benefits incurred from such harvest. These economic benefits may accrue in the form of increased net revenue for commercial vessels, thus increasing producer surplus for the commercial fishery.

Commercial trip limits are generally not considered to be economically efficient because they require an increase in the number of trips and associated trip costs to land the same amount of fish. However, the negative economic effects of this inefficiency can be offset by price support resulting from the supply limitations and the lengthening of seasons. Higher trip limits selected in Action 4 would allow for increased net operating revenue on trips where greater amberjack are landed.

In general, providing increased protection for spawning greater amberjack in Action 5 would be expected to result in improvements in stock abundance and biomass and create indirect, long-term, positive economic effects presumably through the availability of increased numbers of fish in the future. However, there can be some direct, short-term negative economic effects as fewer fish could be available to harvest until the biomass of harvestable fish increases due to the decrease in the amount of time the species is open to harvest. Implementing a spawning season closure and harvest prohibition for the recreational sector would be expected to reduce landings of greater amberjack in the short-term and, consequently, consumer surplus.

The purpose of ACTs is to help prevent a sector from exceeding its ACL due to management uncertainty. Exceeding an ACL would have direct negative economic effects on all sectors potentially due to a reduced stock size. If a species were closed too early for a sector based on the ACT, there would be direct negative economic effects as well because the sector was prohibited from harvesting fish. The ACTs covered by this Action 6 only apply to the recreational sector and are not currently tied to any AMs; therefore, there are no expected economic effects associated with their removal.

Assessment of the Social Effects

The ACL (Action 1) for any stock does not directly affect resource users unless the ACL is met or exceeded, in which case AMs that restrict, or close harvest could negatively impact the commercial, for-hire, and private recreational sectors. While the negative effects are usually short-term, they may at times induce other indirect effects through changes in fishing behavior or business operations that could have long-term social effects, such as increased pressure on another species, or fishermen having to stop fishing altogether due to regulatory closures. Generally, the higher the ACL the greater the short-term social benefits that would be expected to accrue if harvest is sustainable.

Revising sector allocations (Action 2) for the recreational and commercial sectors can result in many different social effects as perceptions are formed. Social effects would also depend upon other actions in conjunction with this one. Therefore, the choice of an allocation would need to be assessed with other actions within this amendment to determine the overall social effects and whether short-term losses are offset by any long-term biological gains. Based on recent commercial and recreational landings, none of the proposed commercial or recreational ACLs are expected to be met, resulting in triggering of the AMs, with the exception of during the 2026/2027 fishing season.

There is a trade-off with reducing the minimum size limit (Action 3) in that an increase in the number of fish that can be kept may improve commercial trip profitability but may also increase the harvest rate and trigger AMs if landings reach the ACL sooner in the fishing year. Available

discard data shows that just under 40% of discarded greater amberjack are less than 28-inches FL, with the vast majority being under the current size limit (Figure 4.4.1.1). As such, reducing the minimum size limit may result in positive social effects for greater amberjack fishermen by increasing the number of fish that can be retained, which may increase trip profitability.

In general, the potential social effects of a higher trip limit (Action 4) would depend on how fishermen are affected by either a higher trip limit and shorter season, or a lower trip limit and longer seasons. The increased trip limit proposed is anticipated to result in direct social benefits to commercial fishing business in the form of increased trip efficiency and indirect social benefits to fishing communities in the form of increased job opportunities and fish available to the market. Proposed increase in the commercial trip limit is not anticipated to result in an in-season closure.

The potential effects on coastal communities of modifying the greater amberjack spawning season closure sale and harvest limits (Action 5) would be a trade-off between the biological benefits of reduced harvest during the spawning season and resulting long term social benefits from a healthier stock and the social benefits of year-round access to fishing opportunities for greater amberjack improving trip profitability and fish available on the market. In general, more restrictive management during spawning seasons may be biologically beneficial to the stock and contribute to sustainable fishing opportunities in the future.

Recreational ACTs (Action 6) are currently not an active part of the management strategy for snapper grouper species and AMs are in place to ensure that ACLs are not exceeded. Therefore, the social effects of removing specified ACTs would be neutral compared to retaining ACTs.

Assessment of Effects on Safety at Sea

Amendment 49 is not expected to result in direct impacts to safety at sea.

Appendix I. Snapper Grouper Fishery Management Plan Goals and Objectives

The Magnuson-Stevens Act national standard guidelines require fishery management councils to establish objectives in each fishery management plan (FMP) and propose management measures that will achieve the objectives. In establishing the objectives, the councils should balance the biological needs of the fish stock(s) with human need, reconcile both present and future costs and benefits, integrate both private and public interests, and provide for a comprehensive approach to addressing problems within the fishery. Also, as the needs of a fishery change over time, fishery management councils are encouraged to regularly reassess the FMP objectives (50 C.F.R. § 600.305(b)).

Amendment 17A to the Snapper Grouper FMP was the last amendment to list and modify the objectives in the Snapper Grouper FMP. In December 2012, the Council began a three-year long stakeholder-driven visioning process to identify long-term strategies for managing the snapper grouper fishery. This process involved evaluating the objectives in the Snapper Grouper FMP and revising them based on the current needs of the fishery. The 2016-2020 Vision Blueprint for the Snapper Grouper Fishery (Vision Blueprint) was approved by the Council at their December 2015 meeting and was intended to inform the management of the snapper grouper fishery through 2020. The Vision Blueprint serves as a “living document” to help guide future management, build on stakeholder input, and illustrate actions that could be developed through the amendment process to address the goals identified during the visioning process. Specifically, the Vision Blueprint is organized into four goal areas: (1) Science, (2) Management, (3) Communication, and (4) Governance. Each goal area has a set of objectives intended to drive management of the snapper grouper fishery (Table 5.7.1). These goals and objectives have been reviewed and recommended for adoption in the Snapper Grouper FMP by the Snapper Grouper Advisory Panel. By including them in Snapper Grouper Amendment 49, the Council intends to formally adopt them as the goals and objectives of the Snapper Grouper FMP.

Table I.1. Management objectives for the Fishery Management Plan for the Snapper Grouper Fishery of the South Atlantic Region.

Goal 1 (Science): Management decisions for the snapper grouper fishery are based upon robust, defensible science that considers qualitative and quantitative data analyzed in a timely, clear, and transparent manner that builds stakeholder confidence.	
<i>Objective 1</i>	Promote collection of quality data to support management plans and programs considered by the Council.
<i>Objective 2</i>	Encourage development of mechanisms to effectively engage and collaborate with stakeholders on cooperative research, data collection and analysis.
<i>Objective 3</i>	Improve knowledge about the social and economic elements of the snapper grouper fishery in the South Atlantic.
<i>Objective 4</i>	Support improved and expanded monitoring and reporting programs for the snapper grouper fishery.
<i>Objective 5</i>	Promote data collection and analysis to support ecosystem and habitat considerations for the snapper grouper fishery.

Goal 2 (Management): Adopt management strategies for the snapper grouper fishery that rebuild and maintain fishery resources, adapt to regional differences in the fishery, and consider the social and economic needs of fishing communities.	
<i>Objective 1</i>	Develop management measures that consider sub-regional differences and issues within the fishery.
<i>Objective 2</i>	Develop innovative management measures that allow consistent access to the fishery for all sectors.
<i>Objective 3</i>	Ensure that management decisions help maximize social and economic opportunity for all sectors.
<i>Objective 4</i>	Develop management measures that reduce and mitigate discards.
<i>Objective 5</i>	Support management measures that incorporate ecosystem and habitat considerations for the snapper grouper fishery.
<i>Objective 6</i>	Develop management measures that support optimal sector allocations for the snapper grouper fishery.
Goal 3 (Communication): Employ interactive outreach strategies that encourage continuous participation and support two-way engagement between managers and snapper grouper fishery stakeholders while building a greater understanding of science and management.	
<i>Objective 1</i>	Develop communication approaches that provide streamlined and timely information to increase awareness and engage stakeholders.
<i>Objective 2</i>	Ensure that Council communication encourages and supports engagement with a diverse audience of stakeholders.
<i>Objective 3</i>	Improve awareness and understanding of fishery science and research and how these inform management.
<i>Objective 4</i>	Improve awareness and understanding of how social and economic issues are linked to fisheries management measures.
Goal 4 (Governance): Commit to a transparent, balanced, and timely decision-making process that allows flexible yet well-defined protocols and strategies for managing the snapper grouper fishery.	
<i>Objective 1</i>	Create an accountable and flexible decision-making process for development and evaluation of management measures.
<i>Objective 2</i>	Build capacity to streamline management efforts and better coordinate with management partners.
<i>Objective 3</i>	Improve communication with stakeholders to ensure the needs of the fishery are understood and considered throughout the Council process.

Appendix J. Allocation Review Trigger Policy

In a letter to the NOAA Assistant Administrator dated July 16, 2019, the South Atlantic Fishery Management Council (Council) responded to NOAA's Fisheries Allocation Review Policy (NMFS Policy Directive 01-119) and the associated Procedural Directive on allocation review triggers (NMFS Procedural Directive 01-119-01). The Policy established the responsibility for the Regional Fishery Management Councils to set allocation review triggers and consider three types of trigger criteria: indicator, public interest, and time. Councils were directed to establish triggers for consideration of allocation reviews by August 2019. The Council's response follows:

The Council has reviewed species allocations on numerous occasions in the past. However, these reviews may not have been formally documented in a fishery management plan amendment if a decision was made not to modify sector allocations. This new policy will ensure all species currently having sector allocations will be reviewed on a regular basis and will formalize the allocation review process so the Council's consideration of allocations will be documented.

The Council reviewed their current sector allocations and began discussions on the Policy and Procedural Directives and criteria for considering fishery allocation reviews at their December 2018 meeting. At their June 2019 meeting, the Council adopted two types of criteria for triggering consideration of an allocation review: indicator and time.

The Council chose several indicator-based criteria as triggers:

- Either sector exceeds its ACL or closes prior to the end of its fishing year three out of five consecutive years,
- Either sector under harvests its ACL or OY by at least 50% three out of five consecutive years,
- After a stock assessment is approved by the SSC and presented to the Council, and
- After the Council reviews a species Fishery Performance Report.

The Council chose a time-based trigger to ensure allocation reviews are regularly considered. Each species will have its sector allocations reviewed not less than every seven years. Table 1 shows by species when the next sector allocation review will be considered by the Council should an indicator-based criterion not be triggered. Regardless of whether consideration of an allocation review is triggered by an indicator or time criterion once it occurs the next one will automatically be scheduled for consideration seven years later. For species which are jointly managed with the Gulf of Mexico Fishery Management Council, the timing for consideration of allocation reviews was coordinated with that council.

A public interest-based criterion was not selected because the Council currently receives substantial and regular comment from the public through scoping and public hearing sessions, general public comment periods held at every Council meeting, the public comment form on the

Council’s website, and through other more informal channels. Thus, the Council decided the existing Council process provides sufficient opportunity for public input on allocation.

Table J-1. Next year for allocation reviews (as of 2019) for SAFMC managed species.

Assessed Species	Review Year

Appendix K. Projection Tables

Recommended levels for the overfishing limit (OFL; Table 1 and Figure 1) and acceptable biological catch (ABC; Table 2 and Figure 2) for Greater Amberjack were updated consistent with recommendations previously made by the South Atlantic Fishery Management Council’s (Council) Scientific and Statistical Committee (SSC), based on the Southeast Data, Assessment, and Review (SEDAR) 59 stock assessment (2020). The SSC’s previously recommended OFL and ABC were from the stochastic projection with fishing mortality rate (F) fixed at FMSY, starting with the first year of management. Additional projections were requested from the Southeast Fisheries Science Center to change the first year of applied management from 2020 to 2022 and extend the projection period through 2026.

Table K-1. Projection results with fishing mortality rate fixed at $F = FMSY$ starting in 2022. R = number of age-1 recruits (in 1000s), F = fishing mortality rate (per year), S = spawning stock (mt), L = landings, and D = dead discards expressed in numbers (n, in 1000s) and in whole weight (w, in 1000 lb). The extension ‘base’ indicates expected values (deterministic) from the base run. The extension ‘med’ indicates median values from the stochastic projections.

year	R.base (1000)	R.med (1000)	F.base	F.med	S.base (mt)	S.med (mt)	L.base (1000)	L.med (1000)	L.base (1000 lb)	L.med (1000 lb)	D.base (1000)	D.med (1000)	D.base (1000 lb)	D.med (1000 lb)
2018	1139	1081	0.28	0.34	6869	5398	196	185	2733	2683	51	13	198	53
