

SSC Report
June Council meeting
Snapper Grouper Committee
June 14, 2017

SSC meeting
April 25-27, 2017

Amendment 43

Red Snapper

Corrected Assessment
ABC Recommendations
Reporting
Descending devices

Red Snapper

Corrected assessment

- Headboat discard index was corrected.
- NMFS: Assessment still BSIA, but landings and discards too uncertain to track any projected ABC.
- Current projected yields still BSIA,
but not useful for management and monitoring.

Red Snapper

ABC

- SSC unable to provide ABC for Red Snapper.
- Continuing upward trend in
fishery independent index =>
high probability reflecting population size increase.

Red Snapper

Recommendation:

- Develop novel index-based approach.
- Will require external peer review.
- Supports attempts to apply DLM Tool Kit and newer DL methods.
- If short season is allowed: permit requirement =>
Data collection by anglers
Caution: unknown scientific and statistical issues.
- Develop sampling design for short season (ages).
- Prioritize development method for measuring fish in video survey.

Red Snapper

Reporting

- Success depends on compliance and enforcement.
- Timing of reporting is critical. Shorter = better.
- Develop verification methods (landings AND discards).
- Consideration to target species when subsampling fishers

Descending devices

- SSC strongly supports use of descending devices
- Compliance is key, consider incentives.
- Instruction and outreach => Citizen Science project.

Red Grouper Assessment

Red Grouper

Review

- ToRs addressed
- Assessment represents BSIA.
- Assessment robust and provides adequate basis for stock status and fishing level recommendations.

Red Grouper

Review:

- Uncertainties were appropriately addressed.
 - M, h, and others well characterized in MCB.
 - Landings characterized in MCB, but used CV is smaller than actual CV =>
overly narrow range of uncertainty.
 - RG in the SA may not be independent from Gulf.
 - Episodic recruitment unknown & source of uncertainty:
Removing highest recruitment:
little effect on stock status.
Multiple recruitment scenarios presented to
address recruitment uncertainty in projections.

Red Grouper

Rebuilding

- Rebuilding not progressed as projected.
- Lower than expected recruitment.
- S19 projections => optimistic, unrealized recruitment.
- Uncertainty in connectivity between GOM and SA, and episodic recruitment may lead to incorrect status conclusions.

Red Grouper

Fishing level recommendations

- ABC control rule: $P^* = 27.5\%$ and $P_{\text{Rebuild}} = 72.5\%$.
- Rebuilding not possible within timeline (2020), even with $F=0$.
- Under low recruitment and $F=0$, rebuilding not possible until 2030.
- Management in 2019: At $F=75\%$ F_{MSY} and $P_{\text{Rebuild}} = 50\%$: stock rebuilt by 2032 (average recruitment)
- $P_{\text{Rebuild}} = 72.5\%$: stock rebuilt by 2037 (average recruitment by 2019).

Red Grouper

- Update or Standard assessment within 3-5 years
(based on availability of new information)
- Monitor discards, age-1 indices, size and age structure
=> Indicators of recruitment.
- Increased landings (now below ACLs) =>
Indicator for possible higher abundance
- Fishery Performance Reports helpful.
- Protect SSB until higher recruitment is realized.

Red Grouper

Research Recommendations:

- Stock structure and early life history => recruitment
- Connectivity GOM and SA stocks.
- Compare age structure northern and southern areas in SA.
- Changes in sex ratio and size and age at maturity and transition.
- Investigate other methods to estimate M.
- Explore episodic recruitment events.

Golden Tilefish ABC

Updated projections and risk

- P^* projections very similar.
- By definition: $P^*=0.3$ less risk than higher P^* .
- Assessment indicated stock close to overfished.
- No compelling new information available.

Golden Tilefish ABC

Recommendations:

- Change previously provided recommendation unwarranted.
- Use ABC CR rather than suite of ABCs.
Recommendations should be based on yield projections with appropriate P^* , not selecting output from various P^* runs.
- Strong support for Standard Assessment ASAP!
Incorporate: Changes in selectivity.
Differences in modeling techniques.
Possible recruitment changes.

ABC Control Rule

ABC Control rule

- CR adjustments implemented in comprehensive amendment.
- Add section with conditions under which ABC recommendation can be remanded back to the SSC by the Council.

Modify CR

- Support overall proposed format.
- All quantitatively assessed stocks in Category 1.
- All qualitatively assessed stocks in Category 2.
- All stocks with only catch data in Category 3.
- Data Workshop can recommend Category.

ABC Control Rule

Risk tolerance

- Council specify range of risk of overfishing for CR.
- Incorporate biology.
- PSA: if used, evaluation by SSC when reviewing TOR.

Multi year ABC

- Support multi-year ABC projections => reduced management.
- Caution using simple annual ABC average.
- Monitoring conducted annually to evaluate ABC effectiveness

ABC Control Rule

Phase-in

- Consider both biological and socio-economic factors.
- Stock must be above MSST for phase-in.

Rebuilding stocks

- Clarify CR concerning setting OFL/ABC for rebuilding stocks.

ABC Control Rule

Carry-over

- More appropriate for stocks with lower M ,
not for those with higher M .
- Do not consider within a rebuilding plan.
- Appropriate in fisheries close to ACLs,
not if well below ACLs.

CR deviations

- Add text clarifying that SSC can deviate, provided strong justification (NS1).

Fishery Performance Reports

- Very useful and important for interpreting landings trends and assessments results.
- Helpful that it separates individual opinion from AP observations!
- Document current conditions =>
historic record =>
helps with shifting baselines.
