1 Introduction

The Southeast Region Headboat Survey (SRHS) is administered by the National Marine Fisheries Service (NMFS) Southeast Fisheries Science Center (SEFSC) at the Beaufort, NC National Oceanic Atmospheric Administration (NOAA) Laboratory and has operated along the southeast coast of the United States (hereafter South Atlantic) since 1972 and in the Gulf of Mexico since 1986. The survey is the longest continuous time series of recreational fisheries data from federal waters on the U.S. east coast, and the second longest time series for the U.S. Gulf of Mexico coast. The SRHS data consists of self-reported logbook records for each trip and biological samples from fish intercepted dockside.

Lengths, weights, otoliths, spines, and scales (for ages), and gonads (for maturity and reproductive parameters) collected from headboat trips by SRHS port agents are used as inputs to stock assessment models and in life history studies. Many of the common reef-associated and pelagic species managed by the South Atlantic and Gulf of Mexico Fishery Management Councils are captured and sampled by the SRHS. For many stocks in the South Atlantic, the index of relative abundance computed from SRHS data is the only source of abundance information prior to 1992, covering a critical time period in the exploitation history of those species. The following document describes general trends for 2020 from various data sources within the headboat fleet as well as summaries for various species of management interest.

1.0.1 Hurricane Season

Tropical Storm Bertha formed off the coast of South Carolina and made landfall near Charleston, South Carolina on May 27, 2020 (SRHS area 5). On August 3, 2020 Hurricane Isaias (Category 1) made landfall on August 3, 2020 near Ocean Isle Beach, North Carolina (SRHS area 3). Impacts from Hurricane Isaias were minimal. The SRHS fleet was not significantly impacted by hurricane activity in the South Atlantic in 2020.

1.0.2 COVID-19

On March 16, 2020 NOAA port agents were instructed to cease sampling operations at the dock. Sampling did not resume for the remainder of 2020. Port Agents contracted through FWC were instructed to follow agency guidelines, and ceased sampling shortly after. All port agents were provided with data entry or QA/QC tasks for telework purposes. Vessel operations varied throughout the fleet in March. Some continued to operate at full capacity, others limited capacity to maintain 6ft social distancing, still others took a maximum of 6-8 anglers per trip. Most vessels ceased operations entirely through April due to mandatory stay-at-home orders. By mid-May most vessels were operating at least at partial capacity as stay-at-home orders were lifted, however the overall number of trips run was roughly 40 percent less than 2019. Fishing did not resume in SRHS Area 12 until June. By June most vessels had resumed operations but running fewer trips and carrying fewer anglers per trip. By July most vessels had resumed operations, with some carrying fewer anglers per trip but others operating at full capacity.

2 Data Collection

The SRHS is divided into discrete geographical/statistical areas to which headboat trips and associated catches are assigned. SRHS port agents are responsible for sampling headboats operating in single or multiple statistical areas. The main components of the survey include the dockside intercept sampling

program (DISP), the headboat activity report (HAR), and the logbook (commonly called the trip report or catch record (CR)).

The DISP is used to obtain length and weight data from landings to determine the size distribution and mean size of species landed in the headboat fishery. Port agents also collect otoliths, spines, scales and occasionally gonads to characterize the age distributions, sex ratios, and reproductive parameters of species landed in the fishery. Port agents may collect other biological samples (e.g., stomachs, fin clips) in support of research or management needs (e.g., trophic interactions and stock structure studies). The SRHS has been a primary source of fishery-dependent data for age and growth studies that are used as inputs for stock assessments in the southeast U.S. During 1972-1991 the SRHS was the only fishery-dependent source of age and growth samples for life history studies in the South Atlantic (sampling of the commercial sector began in 1992). The data collected from the DISP is referred to as the bioprofile (BP) dataset.

The survey design for the DISP can be described as a systematic opportunistic sampling design. Each port agent assigned to a particular area is required to sample all headboats within their area of responsibility in a systematic rotation, ideally sampling each vessel at least once each month during periods of operation. There is considerable variation in the operational schedules of individual vessels and it is rare that agents are able to sample vessels in an exact and repeatable rotation. Consequently, SRHS port agents can adjust their sampling schedules to ensure sampling of all vessels approximately the same number of times each month during periods of operation.

When conducting dockside intercept sampling, port agents are instructed to identify themselves as NMFS port agents conducting a survey of headboat fishing. They are further instructed to identify and select anglers with unusual, uncommon or rare fishes in their catches (on stringers, in coolers, etc.). The rationale for this approach is that if catches with uncommon fishes are selected, sufficient numbers of more common species will likely be obtained as well.

Upon obtaining an angler's catch for sampling, the port agent measures and weighs individual fish using an electronic fish measuring board connected to an electronic balance. All measurements are recorded into computer memory for later download and editing. While sampling, the port agent often performs education and outreach functions by answering bystanders' questions about the SRHS, fish biology and ecology, and fisheries regulations and management. Other than several technological improvements, there have been no significant changes to the dockside sampling protocols since the inception of the survey.

Another component of the SRHS is the headboat activity report (HAR). Port agents record all known information about a vessel's activity (e.g., trip date, trip type, and number of anglers) on the HAR, regardless of whether a trip was sampled under the DISP. These observations are used to track compliance and to correct for non-reporting. The HAR observations are collected by multiple methods, including direct observation, contacting the ticket office to confirm activity, observations made by samplers from other surveys (e.g., MRIP samplers), and in recent years by checking websites for fishing trips.

An important component of the SRHS is the logbook report, commonly called the catch record (CR) or trip report. The CR component was originally designed to be a census, but fluctuations in reporting cooperation have resulted in changes in methodology over time. The survey has always asked or required vessel personnel to complete self-reported trip reports of catch and effort for each trip. From 1972-2012, the mechanism used by captains and crew to report catch and effort was a single-page, paper logbook form.

In 2013, the SRHS electronic logbook (SRHS eLog) was implemented. Since implementation the SRHS eLog has been updated several times, and most updates have been minor adjustments that did not affect the user. The most significant update that did impact the user was in August 2014, when four socioeconomic fields were added: number of paying passengers, number of crew, amount of fuel used, and price per gallon of fuel. Currently the SRHS eLog requires the following fields to be completed for each trip: date(s) and duration of the fishing trip; vessel and captain's name; number of anglers and number of paying passengers;

number of crew, number of gallons of fuel used, and price per gallon of fuel; geographic location of fishing activity in latitude and longitude degrees and minutes (optional point and click maps); minimum, maximum and primary depths fished; number of individuals of each caught species that were kept; and number of individuals of each caught species that were released.

3 Landings

Species with landings > 1,000 lbs in the South Atlantic headboat fishery for 2020 are presented in Table 1². The table includes the species composition ranked by landings (lb), landings in number, and the percent difference relative to the five- and ten-year averages. In 2020 the top ten species landed in the South Atlantic headboat fishery were vermilion snapper, white grunt, king mackerel, yellowtail snapper, gray triggerfish, mutton snapper, Atlantic sharpnose shark, gray snapper, greater amberjack and little tunny.

²Confidential data were replaced with asterisks (***)

Table 1: Species landed ($> 1,000\text{lbs}$) from headboats in the South Atlantic U.S. The 5yr and 10yr column names represent the positive or negative percent difference compared to the five or ten year average for the given species.

species	Landings.lbs	5yr.lbs	10yr.lbs	Landings.n	5yr.n	10yr.n
vermilion snapper	120,227	-15.9	-18.2	112,951	-10.9	-9.9
white grunt	81,297	-22.7	-28.7	113,883	-17.5	-22.7
king mackerel	67,784	-15.8	-20.1	7,506	-23.3	-21.8
yellowtail snapper	66,680	-38.9	-43.4	77,341	-33.3	-36.7

4 Discards

Species with discards $> 1,000$ fish in the South Atlantic headboat fishery for 2020 are presented in Table 2³. The table includes the species composition ranked by discards and the percent difference relative to the five- and ten-year averages. In 2020 the top ten species discarded in the South Atlantic headboat fishery were black sea bass, vermilion snapper, white grunt, red snapper, tomtate, yellowtail snapper, Atlantic sharpnose shark, gray triggerfish, mutton snapper and gray snapper.

Table 2: Species discarded ($> 1,000$ fish) from headboats in the South Atlantic U.S. The 5yr and 10yr column names represent the positive or negative percent difference compared to the five or ten year average for the given species.

species	Discards.n	5yr.n	10yr.n
black sea bass	242,899	-37.4	-55.4
vermilion snapper	62,729	-26.1	-22.4
white grunt	56,775	-0.6	5.9
red snapper	53,042	3.3	7.4
tomtate	45,644	-19.4	-23.6
yellowtail snapper	43,675	-12.1	-7.1
Atlantic sharpnose shark	15,390	-24.4	-33.1
gray triggerfish	14,518	-54.8	-38.5
mutton snapper	13,359	-14.5	23.4
gray snapper	10,288	16.3	9.8
lane snapper	10,214	1.1	61.1
blue runner	9,001	-52.6	-55.6
graysby	5,647	37.1	55.8
red grouper	5,004	-38.3	-36.0
remora	4,817	-19.3	-6.6
red porgy	4,323	-55.8	-67.1
littlehead porgy	3,629	128.4	320.3
spottail pinfish	3,135	-40.8	-38.9
croaker atlantic	3,070	25.3	112.4
blacktip shark	2,188	31.0	50.5
greater amberjack	2,177	-14.2	-26.6
pigfish	2,127	-4.5	5.7
squirrelfish	1,954	-53.6	-53.0
little tunny	1,818	-46.9	-65.2
bank sea bass	1,587	-45.5	-43.8
cobia	1,372	17.1	12.9
king mackerel	1,132	-18.4	-17.5
almaco jack	1,104	-39.5	3.6
scup	1,039	-29.7	-45.4

5 Dockside Intercept Sampling Program

Species with > 30 fish sampled annually in the South Atlantic headboat fishery for 2020 are presented in Table 3⁴. In 2020 the top ten species sampled in the South Atlantic headboat fishery were yellowtail snapper, white grunt, lane snapper, littlehead porgy, gray snapper, black sea bass, jolthead porgy, blue runner, vermilion snapper and knobbed porgy.

Table 3: Species sampled dockside from headboats in South Atlantic U.S. including distribution by region. The 5yr and 10yr column names represent the positive or negative percent difference compared to the five or ten year average for the given species.

species	Fish(n)	Carolinas(%)	Ga-N.FI(%)	S.FI(%)	5yr(%)	10yr(%)
yellowtail snapper	623	NA	1.0	99.0	-79.3	-80.7
white grunt	502	4.4	2.6	93.0	-77.4	-82.0
lane snapper	487	NA	32.9	67.1	-55.2	-51.9
littlehead porgy	378	NA	NA	100.0	-21.5	-8.1
gray snapper	254	NA	54.7	45.3	-77.6	-80.9
black sea bass	143	74.1	25.2	0.7	-82.2	-88.9
jolthead porgy	123	NA	0.8	99.2	-45.1	-45.0

2005	65,609	49,539	123,300
2006	81,810	48,908	126,614
2007	89,731	53,762	103,388
2008	64,445	52,345	71,598
2009	60,387	66,447	69,973
2010	66,022	53,676	69,986
2011	63,102	54,707	77,785
2012	61,769	58,901	88,798
2013	61,510	66,587	99,092
2014	64,716	60,752	135,138
2015	62,418	54,480	140,499
2016	63,772	53,387	143,273
2017	57,084	48,304	77,822
2018	54,424	43,586	76,974
2019	57,022	43,139	76,573
2020	48,234	30,750	53,255

7 Catch-per-unit-effort

This report presents catch-per-unit-effort (CPUE) calculated as the simple ratio of raw catch divided by raw effort (angler days). For CPUE to reflect true population abundance several factors must exist, which can be summed up in the term catchability. Catchability is best described as a measure of the overall efficiency of the fishery. Catchability can be affected by many factors including species targeting, management restrictions, gear changes, technology improvements, etc. All of these factors combine to affect the relationship between CPUE and true population abundance. Only under very strict, static conditions through time will CPUE reflect true population abundance. Therefore, the CPUE data presented in this report should be interpreted with an understanding of the factors that can affect catchability in the fishery. The CPUE values in this report are not the values that get used in the abundance index for stock assessments. The stock assessment process (e.g. SEDAR) typically employs statistical modelling techniques (e.g. GLM analysis) to account for co-varying factors that may affect catchability.

8 Species Overview

The following section provides species-specific summaries of landings, discards, dockside sampling, effort, and the nominal catch per unit effort time series⁵. Species included in the following summaries were chosen from the SAFMC snapper/grouper complex along with additional pelagic species that are encountered frequently in the survey and are typically of interest to the Council. Data from several species (black snapper, misty grouper, Nassau grouper, etc.) were limited or confidential and therefore filtered from these summaries.

⁵Confidential data were replaced with asterisks (***)

8.53.3 Dockside Intercept Sampling Program

Regional sample sizes, average length (in.) and weight (lb) are available in Table 215.

¹¹⁰Confidential data were replaced with asterisks (***)

¹¹¹The nominal index reflects the raw data and does not necessarily reflect fluctuations in population size. A more thorough examination of these data are required before associating these time series with abundance.

Table 215: Dockside intercept sampling program summary by region and 5 year, 10 year and cumulative averages.

Region	Len. (n)	Wgt. (n)	Avg.len(in.)	Avg.wgt(lbs)
GA.N.Florida	6	6	12.4	0.6
S. Atl.(10 yr)	32,078	29,578	14.1	1.0
S. Atl.(5 yr)	14,928	13,274	14.0	0.9
S.Florida	617	573	14.2	1.0

8.55.5 Catch per Unit Effort (CPUE)¹¹⁵

Figure 110: Nominal index (catch/angler days) from headboat logbooks.

¹¹⁴Confidential data were replaced with asterisks (***)

¹¹⁵The nominal index reflects the raw data and does not necessarily reflect fluctuations in population size. A more thorough examination of these data are required before associating these time series with abundance.

9 Economic Data

Large for-hire fishing vessels, called headboats or party-boats, play an important role in the Southeast’s recreational fisheries. Headboats provide an affordable way for individual, often unscheduled, customers to participate in a half or full day (or longer) of bottom or drift fishing. The customer is typically charged \$40 to \$100 for a fishing trip that includes the gear, bait, and fishing instructions. This fact sheet summarizes the data collected on the number of crew, the number of non-fishing passengers, the gallons of fuel used, and the price paid per gallon of fuel from South Atlantic headboats during 2020. In previous years of this fact sheet, we removed the following from the database: trips more than 12 hours; trips by vessels that are not permitted to take more than six passengers; trips that took less than seven passengers; and trips by vessels that took fewer than 10 trips in the year. For 2020 we are not removing any trips, i.e., we are reporting the summary statistics for the database as reported in the logbook. There were 66 South Atlantic headboats in the database for 2020 that reported a total of 9,742 trips.

Descriptive statistics for trips in the South Atlantic are presented in Table 1.

	mean	sd	median	min	max
Gallons	62.93	79.59	40.00	1.00	1200.00
Price per Gallon	2.66	0.81	2.65	0.10	8.00
Anglers	20.04	14.86	15.00	1.00	113.00
Passengers	20.09	15.00	15.00	1.00	196.00
Crew	1.77	1.12	1.00	1.00	18.00

The average trip characteristics by duration of 2020 trips in the South Atlantic are shown in Table 2. Longer trips use more fuel on average, nearly doubling with each duration increment. The remaining trip characteristics also seem to increase with duration. However, the difference between each trip duration for each characteristic is not large.

Duration	Gallons	\$/Gallon	Anglers	Passengers	Crew
1/2 day (3-5.99 hours)	36.35	2.75	18.32	18.35	1.58
3/4 day (6-7.99 hours)	61.23	2.67	23.70	23.74	2.04
Full day (8-9.99 hours)	109.52	2.51	23.88	24.12	2.18
Full day plus (10-12 hours)	182.23	2.15	23.76	23.77	2.15
other	427.35	2.11	26.32	26.32	3.79

The average gallons used per hour by month on headboat trips across the year in the South Atlantic is shown in Figure 1. Headboats tend to use the most fuel per hour during the summer months in the South Atlantic.

The top panel of Figure 2 shows the average gallons used per headboat trip from each county. Similar maps are shown for the number of passengers and the number of crew in the other two panes of Figure 2.

Figure 1: Gallons of fuel used per hour on headboat trips by month

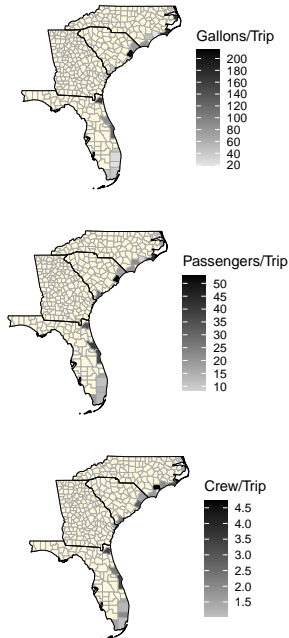

Figure 2: Headboat trip characteristics by home port county.

10 Acknowledgements

We thank the many headboat captains, crew members and NMFS port agents for their efforts in providing data throughout the many years. We would also like to thank those that contributed text and valuable feedback during the development of this report including Erik Williams, Kyle Shertzer, Ken Brennan, Todd Kellison and David Carter.
